The "BEST"

IBM Compatible Microcomputer

See the Review
in March 1984
Computing Now!

\$1995

Not a kit — a complete system

This price includes:

- 64K of RAM with pre-socketed provision for 256K
- One disk drive. SA455. Double Sided. Double Density
- Colour Video Board
- Floppy controller capable of handling up to four DS, DD 5 1/4" disk drives and socketed for optional serial port and real time clock
- Monitor not included

Warranty:
Full 120 day
Warranty

Prices does NOT include
IBM (Microsoft) BASIC

OR The Loaded "BEST"

Everything in our \$1995 System plus:

- Two DS, DD 5 1/4" Disk Drives
- On-board 256K of RAM
- RS232 Port

\$2595

OR 10 Meg Hard Disk Version

Everything in our \$1995 system plus:

- 10 Meg Hard Disk Drive & Controller
- On-board 256K of RAM
- RS232 Port

\$3995

SOFTWARE FOR YOUR IBM

- Lotus 1, 2, 3\$439
- Wordstar\$399
- Multiplan\$219
- dBASE II\$479
- Flight Simulator\$62.95

Great Selection of other software for your IBM available.

IBM is a Trade Mark of IBM Canada Limited

PERIPHERALS FOR YOUR IBM

- Color Video Board\$339
- Floppy Controller Board\$299
Has provision optional RS232 port and real time clock.
- Parallel and Game Port Card\$149
Will also drive parallel printer
- 256K Memory Expansion Card and real time clock. Allows you to add a further 256K to your IBM's existing 256K capacity for 1/2 Megabyte of total memory.
With 64K RAM on board\$289
With 128K RAM on board\$369
With full 256K RAM on board\$530
- EPROM Programmer\$149
For 2732, 2769 and 27128.
- Disk Drive - SA4555\$299
- IBM Compatible Case\$ 99
- IBM Compatible Keyboard\$189
- Super Heavy Duty Power Supply\$ 69

OUR FAMOUS 6502 BOARD

NOW NEW & IMPROVED VIDEO SECTION

This 6502 board is a vast improvement on others available:

- 64K RAM (8-4164 chips)
- 80 x 24 video included on board
- Floppy Disk Controller included
- FIVE additional slots
- Z80 blank PCB included
- Powerful power supply (5V 5A, +12V 2 up to 3A peak, -5V 0.5A, -12V 0.5A)
- Hydro-approved whereas many others are not!
- Superb quality plastic case
- Excellent keyboard including numeric keypad
- EPROMS (blank) included
- Available preassembled by special order only.
- Ideal for educational applications.

\$679

Our prices are low due to our mass production assembly, which makes it hard for others to compete.

NOW you receive a **FREE** Z80 PC BOARD **AND** **FREE** 128K RAM DISK PC BOARD when you order the complete package (either Kit or A&T) (BLANK

Our boards are professionally made, flow soldering & cleaned & use only high quality prime parts.

Introductory Offer

8088 System \$1,989

Best Prices in Canada

Complete System with 64K, expandable to 256K. Comes with Colour Graphics, Floppy Controller and one DS, DD 5 1/4" Disk Drive, Keyboard, Case and Extra Heavy-Duty, Fan Cooled Power Supply.

System comes with 5 peripheral slots. Optional 8087 arithmetic processor available. Floppy controller can handle up to 4 drives and as an option can a serial port and real-time clock. Completely built and tested and sold with a blank EPROM. Compatible with You-Know-Who. Systems are now in stock but due to extraordinary demand at time of going to press, order now to prevent delays. Please Note: We do not sell any proprietary software.

May 1984

6 Revenge of all the BBS Numbers In the World

On the reasonable assumption that there are still no technologically civilized settlements outside Canada this list of systems doesn't take in anything beyond our borders. However, we've checked out virtually every public system in the land.

10 Poker

While not so lively as the Frogger nor so exciting as the Microsoft flight simulator, CN! Poker is an interesting computer game that lets you best the pants off something normally incapable of wearing any.

16 Data Base Managers

The prospect of having a computer reduce the kilotons of paper presently engulfing your desk top down to a five and a quarter inch disk may sound appealing. However, make sure you're getting a data compactor . . . and not a trashmasher.

22 Turbo PASCAL

Low cost language packages are everywhere. Most of them are turkeys and some would require considerable work to even manage this status. Here's a look at one, however, that's anything but.

26 The New Printers

Once there were just dot matrix and daisy wheel printers. However, that was too easy and after a while there came to be assorted mutations and fusions of the two. Here's a peek at the various resulting creatures.

30 C64 Peripheral Survey

If it plugs in, snaps on, attaches to, hangs over, sits under, goes behind slips inside, enhances, modifies, controls, extends, mutates or teleports into the fourteenth dimension the humble Commodore 64 it'll be here.

34 Morrow Review

Really powerful slick business systems do not all have 8088's in them. This one runs CP/M Plus and does some pretty amazing things.

38 The Apple II Something

There's another new Apple on the way. It's compatible with the Apple II+ and yet has a hundred and twenty eight K of RAM and fits in a briefcase. Beware, ye clones . . .

40 Don't Shoot The Printer

As frustration sets in and you begin to wonder whether you wouldn't have been better off with a couple of monks and some quills leaf through this feature. It'll help you to better understand the complexities of printers.

Next Month in Computing Now!

IBM Supplement

Next issue we'll be looking at a number of things of interest to owners of PC compatible systems. . . and owners to be. As the prices of these computers drop more and more souls are finding that they are powerful and cost effective ways to get a handful of the state of the art. We'll scrutinize the state next month.

Fables of the JLS XT

Not resting on his chips, Joe Sutherland once more sallies forth with his trusty steed and his do it yourself printed circuit board kit to produce a system which emulates the powerful IBM XT. A full review and royal gala takes place next issue.

Local Area Networks

While large and expensive, LANs are one approach to having several computers share the same facilities. However, they do have their trickier aspects, and none of the major systems are the least bit compatible with each other. Nothing more complicated than a rock is ever understandable.

Untitl	✓Plain Text	⌘P	
	Bold	⌘B	
	<i>Italic</i>	⌘I	
	<u>Underline</u>	⌘U	
	Outline	⌘O	
	Shadow	⌘S	
	9 Point		

MacWrite

The Macintosh word processor is a thorough party to use with facilities which make earlier word processors look like hand presses by comparison. In the next issue we'll be looking at the features and capabilities of this exciting bit of software. Drool . . .

Rescue Your 64

As you get more sophisticated at programming your 64 you'll also find yourself coming across that agonizing situation of having a computer full of code which hangs up. Next month we'll be having a look at the structure of the 64's program storage and a way to unhang even a comatose machine.

74 Search For Wordstar

Detailing with large Wordstar documents can often be a bit easier if you know the secret rites of search and replace. Remove all the vowels? It's as easy as control Q.

46 Software Buccaneers

Software piracy and the law have always been a bit touchy when put in the same room together. This features looks at the grotty details.

52 The Fruit Crate BBS

Entirely written in Applesoft except for the bits that aren't this simple BBS package will turn you into a SYSOP without a similar transformation of your bank account into a black hole.

61 List! Special

From printers across the land have spewn forth these programs . . . pages of them. If you like to meddle with bits of code you'll have a blast with this.

64 SSM Modem Review

The cool thing about smart modems is that they'll do an amazing amount for you. The uncool thing is the price you pay for one. Here's slightly less ruinous card stuffed with capacity.

68 Get SMARTS

You want function keys, don't you? Everybody likes function keys. However, not everyone has the keys. For those not thus blessed we present SMARTS, software which takes up the slack.

79 Word Processing Survey

There are word processors available for virtually everything with a keyboard. This overview should help you get the confusion down to a manageable hugeness.

82 Forth

As weird little languages go this is one of the weirdest. However, Forth is a powerful way to write sophisticated applications that run very, very fast.

86 The Doctor's Little Black Computer

The medical community . . . really isn't into computers very much. A practicing physician takes a look at the state of the art.

Revenge Of All The BBS Numbers In the World

We'd originally entitled this as 'I Was a Teenage All The BBS Numbers In The World,' but the title ran off the page...

by Brian Greiner

Once again, setting forth on his gallant modem, the three hundred baud knight went off to challenge the bulletin boards of our fair land. This list is the spoils of his quest... all of the systems in the entire world, as of our going to press, with the exception of those outside Canada.

This is as good a list as there can be. All of these numbers were called at least once. The growing interest in boards resulted in our brave warrior getting a busy signal a lot of the time... but this would indicate that there was at least some life out there. About a third of these systems have actually been logged onto.

A few of these boards are marked with asterisks. These are systems which purported to be up but didn't answer when they were called. Perhaps they were just down or perhaps they have vanished into the night from which they sprang... forever.

Protect your investment with Xerox Maintenance Agreement

Fully backed by Xerox, the leader in PC Maintenance Service!

Xerox provides two
Maintenance Contract
Options to meet your
individual needs:

Option 1 — Customer
Carry-In to a Xerox
Service Centre

(Our most
economical
option)

VISA card accepted

Option 2 — Xerox Provided
Pick-Up/Delivery Services

(Just phone for Xerox
pick-up and when it's
ready, we deliver.)

* Xerox Provided Pick-Up/
Delivery Service is
restricted to pre-defined
geographic zones.

Support

Perhaps the most important thing Xerox
Service Centres offer you is support. You
will have the entire national Xerox Service
Centre force at your disposal.

This means your Xerox Service Mainte-
nance Agreement Card will be honoured at
any Xerox Service Centre across Canada.
(Time and Material Rates also available)

Circle No. 15 on Reader Service Card

Bulletin Board

UltraPAK, a recently introduced add-on board for the IBM PC from *Tseng Laboratories* allows full compatibility with the Lotus 1-2-3 software package. The card contains a serial and parallel port, a clock/calendar, and a one hundred and thirty-two column video display...

A truly varied CP/M word processor, **Palantir**, is being distributed in Canada by *AMIES*. Aside from standard word processing features, the product offers proportional spacing and file merging...

Office Specialty is offering a line of computer workstations for both flexibility and comfort. The **DataGroup** furniture's modular design allows it to be used in individual units or be integrated into a total office system...

Super Text Professional, a popular word processor from *Muse* is now available for the Atari line of microcomputers. The program requires a minimum of forty-eight K of RAM, and offers a variety of printer drivers...

Two new diskette storage cases are now being produced by *Amaray Corporation*. **Media Mates 3** and **5** have built-in handles, and hold thirty and fifty diskettes respectively...

A new 60008 co-processor card for the Apple II computers is now available from *Stellation Two*. Code compatible with the 68000 chip, the **McMill** is bundled with Fig forth software. An optional assembler is also offered...

Version four of *Stoneware's* **DB Master** program can now convert Apple II files from VisiFile and pfs:File into those compatible with DB Master. Once converted, the new files have a greater storage capacity...

File Mover, a CP/M utility that runs on any 8080, 8085 or Z-80 processor has been introduced by *Brydan Business Systems*. Using a serial RS232C link, the program can transfer any type of CP/M file from one computer to another with error detection, correction protocol and automatic retry...

Arctic Data has announced **Patient Recall System**, a professional package for CP/M-80, CP/M-86 and MS-DOS systems. The menu driven program facilitates appointment scheduling with automatic recall card generation and printing...

The Comrex **CR-II** daisy wheel printer has been introduced through *Epson Canada Limited*. The inexpensive letter quality printer operates bidirectionally at twelve characters per second and has a five K buffer...

BPI and **MicroPlan** are two new packages for the Hewlett-Packard Touchscreen Computers. The software packages have been enhanced to accept alternate input from users touching the *HP-150's* screen...

Monroe Systems For Business have unveiled a new sixteen bit business microcomputer. The one hundred and twenty-eight K **System 2000** uses the 80186 processor and comes with CP/M-86 DPX, MS-DOS and GW BASIC...

A sixty-four K printer buffer with pause, hold, and hex dump features is being manufactured and distributed in Canada by *Computer Age Ltd.* The **Angel** is supplied with both RS232C and Centronics interfaces...

Peachpak 4, a business accounting package from *Peachtree Software* has been enhanced and is now available for the IBM PC, its compatibles, the TI Professional and the Zenith Z-100...

An improved version of *Batteries Included's* word processor for the Commodore 64 is now on the market.

PaperClip can now support eighty columns through either software or hardware, and carries over one hundred printers in its internal configuration files...

A multi-expansion port for Timex Sinclair computers, the **Softbox**, is available from *Intercomputer Micro Systems*. The port offers four expansion slots, a card edge, and a computer on/off switch...

A software sailing tutorial and manual entitled **Regatta** can be purchased from *Lenbrook Electronics*. Produced for the Apple II computer, the disk simulates four different races on a choice of four lakes...

Alternate Computer Training is a new project created to train and place physically handicapped adults as **applications programmers**. Once an aptitude test is passed, applicants become employees of A.C.T. while being trained. The training is free, as is placement...

Netmaster, a terminal program for the Apple II computer from *Zoom Telephonics* provides a forty K buffer for sixty-four K systems, and can transmit and receive any DOS 3.3 file. It can be purchased separately or bundled with Zoom's Networker modem...

Ahem... a correction. A posting in Bulletin Board in the March issue implied that **Corona PCs** were now only being sold in Canada by Olivetti. It seems that Olivetti, (and recently, Philips Information Systems) entered an agreement with Corona Data Systems of the U.S. whereby they would be allowed to re-label the Corona and sell it under their house name. This agreement does not affect the availability, sale or supply of the original Corona PC and portable, which are still marketed by **Scarsdale** all across Canada.

POKER!

Playing poker with a computer has its advantages. It doesn't cheat, it doesn't try to read your face and if you find yourself in the hole to it, you can shut it off. Here's a byte of software to deal your system.

by Steve Rimmer

There's a certain mystique about a decent game of poker . . . especially one which runs on for a few days. Check out the players . . . there's this tall dude back in the shadows wearing a Lee Van Cleef outfit who never says anything. There's a little man dealing, sweating profusely as he eyes the fellow to his right . . . a muscular, evil looking gentleman with false eyelashes who keeps rubbing the handle of a gun protruding from his pocket. Hovering about the table is a gorgeous blonde in a black satin evening dress smoking a joint in a cigarette holder . . .

The night draws onwards to dawn as the small man places the last of his stake in the centre of the table and deals himself two cards. The cowboy smiles and lays down a straight . . .

Months of programming have failed to come up with anything resembling a gorgeous blonde in a black satin evening dress. However, we can make a computer play a pretty mean hand of poker. In fact, it's possible to give it a personality and a definitive strategy. What's more, it can even manage to keep its face straight when it has a good hand.

Presented herein is a simple poker program. While it ignores some of the freakier manifestations of the game, it does manage to get the essential elements into a fairly short bit of code.

Written in Microsoft BASIC, it should be useable . . . or adaptable . . . for virtually any system.

Draws and Calls

The program starts you, and the electronic player directly in front of you, off with five hundred dollars . . . or any other currency you fancy. You can change the stake in line 230 of the program. It displays two hands on the screen in fairly rudimentary graphics

. . . MBASIC doesn't allow for visual nuance. Then it just lets it all happen.

The game is fairly simple and deviates from the most commonly encountered versions of poker in a few ways. It's a five card hand with nothing wild and two one-card draws. The computer will bet first, after which you can bet and draw your stuff. When you've stopped drawing the machine will play its hand and figure out the results.

Winnings and losings are calculated and the respective pots adjusted at the end of each hand.

A lot of the work in writing this sort of game is that it wants to get large . . . it's possible to program incredible amounts of nuisance into it without half trying . . . leaving everyone else with the task of entering the nasty code and making it work. This version is probably a fair compromise, and it does play a pretty serious game. If you feel up to it you can easily add some additional stuff to it.

The deck of cards is held in the array DECK\$, as read from the DATA statements commencing in line 150. In dealing a card the program . . . down in line 2010 . . . picks a random number between zero and fifty-one and examines that entry into the card table. That's a virtual card table,

without folding legs. If it's a valid card, it exchanges it with the string "XX". This way, subsequent deals can't pull the same card twice.

One of the problems with this sort of program is that it requires real random numbers. In fact, straight MBASIC can't produce these... the function RND returns entries in a table of pseudo-random numbers. While this works for most applications, such as statistical analysis, it kind of fails for card games as you wind up playing the same hands each time you start the game. Thus, the random number generator must be seeded before each hand.

Seeding the table doesn't make the numbers any more random, but they will appear so, because there is no immediate correlation between seedings unless you force one. A seed is just any number between zero and sixty-five thousand and something. In the case of this program, it asks for a four digit number before each hand. The digits don't echo back to the screen, by the way... inaccuracy is a desirable feature in getting a random number seed.

In many cases you will be able to dispense with the manual seeding. Standard version five MBASIC is actually one of the few which does not allow any way to do this. Most others seed the generator automatically by using the time between keystrokes.

If yours doesn't do so, you can still get it together if you have the INKEY\$ function available. Do something like this...

```
440 PRINT CLS$: STRING$(22,LF$); TAB(PD); "Hit
any key to continue";
445 AS=INKEY$: A=A+1 : IF AS=" THEN 445
447 IF A 65536 THEN A = A - 65536 : GOTO 447
450 RANDOMIZE (A)
```

The value of A will thus be dependant on how long it takes you to hit any key to continue.

Many versions of MBASIC don't have INKEY\$... they return a null set even if you drop a brick on the keyboard. If this is the case with yours, you'll be stuck with the code as it's presented here.

Raise

In order to play the game, the computer has to be able to analyse the hands dealt. First off, it has to know who won and, secondly... and more difficult to execute... it has to know what to trash and draw in playing its own hand.

Analysing a hand is basically an exercise in pattern matching. This is a whole lot easier if the cards are in some sort of order to begin with. As such, the first step of any analysis is to sort the cards into numerical order in the routine beginning with line 1070.

This subroutine does what is called a bubble sort. Bubble sorts are a crude but simple way for ordering data. Basically, you take a stack of information and scan through it. Any time the program finds that two entries are in the wrong order, it swaps them and sets a flag to say that its done something. When it gets to the end of the list, it looks at the flag and if it has been set, goes back and scans the list again.

As soon as the flag comes back unset it knows that the list has been sorted completely and that further passes through it won't change it any.

Having ordered the cards in a hand . . . you'll find that they are always displayed sorted . . . the program can look for the things a human checks out in a poker hand. The criteria for these start at line 1160. When broken down these things are extremely simple, and are nothing more than looking for occurrences of patterns in the cards.

Sounds a bit like reading the tarot, this.

Making the computer analyse its own hand so it will play an intelligent game is a bit trickier because it has to look for the existence of incomplete patterns. More to the point, it has to manipulate its hand so as to avoid chomping the patterns it already has.

In fact, this program plays a fairly simple game. You can easily add some nuance to it if you want but . . . be warned . . . as you get the machine more sophisticated in the way it deals with its own hand, the code begins to grow like something green and nameless from the swamp. Furthermore, it will beat you a lot.

Wild Cards

I can think of few things more satisfying in life than taking an innocent computer and teaching it some bad habits. While many computers instinctively avoid strong drink, making one gamble is relatively simple. The one at work has been thoroughly corrupted by now, and very often will tell people who call the bulletin board at night to stop reading messages and "shut up and deal".

However, it does lose gracefully. It doesn't heave its cards on the table and kick over the furniture. It takes its defeats like a true pile of silicon and fiberglass and only starts to pound its tube against the wall, sobbing hysterically, once it's sure that everyone else has either left the room or powered down.

CNI

"Kaypro 2...\$1995...Complete..."

Oh, mentor of highest wisdom, help all mystified first-time buyers discover the ultimate truth about personal business computers.

Tell them that, unlike other computer companies, Kaypro does not advertise a low "starter system" price, then charge extra for so-called "options" like a monitor, software, disk drives or peripheral interfaces.

Tell them that Kaypro 2 has become the fourth largest-selling personal business computer because we sell it complete. For \$1995.

Tell them that Kaypro 2 comes with a highly readable, 9" green-screen monitor. A 64K RAM, Z-80 microprocessor. Two built-in disk drives with a 400K capacity. A more complete keyboard than Apple IIe. Interfaces for both a printer and a telecommunications modem. And a full complement of CP/M software to handle the overwhelming majority of Word Processing, Data Base Management and Financial Spreadsheets needs, with top quality programs such as Wordstar.

All for \$1995

Then, tell them to call (403)482-7363 for their nearest dealer, or write Computron: 10641-123 Street, Edmonton, Alberta T5N 1P3

KAYPRO

The \$1995 computer that really sells for \$1995.

Circle No. 13 on Reader Service Card

Data Base Managers

Data base management packages can be a bit sneaky. There are heaps around, and none of them make any sense at all until you're six months into the melee. Here's a look at some of the things you should ponder on prior to prying loose your Visa card.

by Garry Frankel

Have you ever found yourself surrounded by mounds of paper while you spend hour after hour going through all kinds of data just to find the one piece of information you want? Perhaps you are the secretary treasurer for your club or church group and you are tired of keeping all your membership lists by hand, writing on envelopes for mailings and flipping through cards to see who is behind on their membership dues.

Do you spend one day a week tallying up your sales reps' work and commissions so that they get paid on time?

If you can answer yes to any of these questions... or anything sounding remotely like them... then you are the kind of person

who can benefit greatly from having a microcomputer with good database management software. You may have already figured this out. Your problem is likely choosing an appropriate package.

Up until about a year and a half ago there was not very much to choose from. If you owned a C/P/M based system then dBase II was about your only hope. If you owned an Apple there was PFS. While a bit restrictive this did serve to keep things simple.

There are now about a hundred different brands of software available that are designed to help you keep track of data. What we are going to do in this article is to describe the different attributes of such soft-

ware and explain the different technical terms that are used to describe these programs. We will not be listing all the software available, but we will try to give you the tools so that you can go out and make an intelligent choice of where to lay out your long green.

The Hardest Part

Let us start this examination with a definition of the term *database*. Because I'm writing this we will use my definition, which is as follows. A database is a collection of information that has some kind of form or structure. If the task you have in mind is not amenable to having the data structured in some way then you will have a tough time

finding any system that will help you. If the facts you wish to organize and manipulate can be put on some kind of form, then you're actually about half way there.

Unfortunately, it's the easy half.

To explain how a database is structured, I will use the old filing cabinet example. If you kept all the records of your club in one filing cabinet then this would be your database. In this filing cabinet you might have different file folders. One might be your master mailing list of members, another might be the records of membership dues and fees. You might also have separate files for all the special projects your members participate in.

We usually call these folders *files* in

database talk. Within each file are sheets of paper, one for each member or what have you. These sheets are called *records*, each sheet being a separate record. On each record sheet we have blanks into which we put specific information. These blanks are known as *fields*.

In essence, then, a database consists of files of information. Each file contains separate records and each record is made up of several fields.

Software manufacturers usually call this type of software by the initials *DBMS*, which stands for data based management system.

We can break DBMS programs into two basic types. The first grouping would be what I call list or file managers. List managers are simple programs that let you easily store and retrieve information. Most allow for some kind of printout that make them good for keeping simple mailing lists and such. Very few of the programs in this category will allow you to do a lot of intricate math or to access more than one file at a time.

The second group of software is usually called *Relational DBMS* programs. I deem a DBMS to be relational if it lets you access more than one file at a time. For example, you can enter data into a file and instead of having to look up all of a member's data and then re-enter it by hand into a new form, you can just enter the membership number and the program will go and look up their information and enter it for you. You would then add the other data that is unique to the file you are working on. These programs are usually much more sophisticated than file managers and often allow for some fancy math and string handling functions.

DISKourse

Almost all DBMS programs store their data in one of two ways. *Variable length records* allow you to store data on diskettes by only taking up as much room as the information you entered required. The most common way of doing this is to have the program place a comma between fields and a carriage return at the end of each record. If this were placed on your screen it might look something like

Smith, John, 12
Mystreet, Anola, MB, ROK-1BO(MJ)

Fixed length records, on the other hand, will always take up as much room on the disk as you have allowed for on your input screen. Some systems just insert blanks while others will pad the data with a character such as a zero. For example, if you had defined the last name field as taking

up to twenty spaces and allowed up to fifteen for the first name the file record would look something like this...

Smith-----
John-----12 Mystreet

The advantage to variable length records is pretty obvious. You can allow for a potentially long entry and end up using only as much disk space as is actually used. The advantage to the fixed length records is that it is easier and faster to find a given item of information because the software does not have to read each character to find the commas so that it can know where the fields separate.

There are now about a hundred different brands of software available to help you keep track of data ...

Record storage methods will obviously affect the way you use a particular DBMS, specially if you have limited disk capacity. Most programs will also have other limitations. These include an absolute maximum number of characters per field, a maximum number of fields per record, a maximum number of records per file and a maximum number of files per database. The popular dBASE II package, for example, will only allow thirty two fields per record and allows only two files to interact at a time. For some problems this can be severely limiting.

Almost every type of DBMS you can buy today, makes use of what are known as *index* fields. These index fields, or just indexes, are what allow you to find data very quickly without having to get your computer to read every byte in a file to find the record you want. When you define your record form you will designate one or more fields to act as your *key* index.

If you think of that club membership list and if we assign each member an individual membership number, then we can use the latter for a key index so that by typing in the membership number you will get that record onto your screen or printer pretty fast.

You might think of indexes as being little files that orbit around your big files. When you want to find something in a hurry

[illegible]

Moorshead Publications warrants that the software provided will be readable. If defects in the medium prevent this, we will replace your disk. While we have made every effort to ensure that these programs are debugged, we are unable to assist you in adapting them for your application.

Data Base Managers

Much of the power of data base is in letting individual users manager their own information

your computer only has to read through the index file and in that file will be a pointer to the record in the big file.

Indexes are very important things because most DBMS systems use their indexes to decide the order in which data is sorted and stored. This can be crucial later on when you decide to design some kind of report that summarizes or prints out the data you have stored.

Indexes and Outdexes

There are important differences in the way that different software packages use index fields. Some allow you to only use one field in an index. This would mean that you could only sort your data by one parameter. Others allow several fields to be put together to form one key. They would usually assign each field a different level of importance in the sort order. For example, if you wanted to print out your club membership first in postal code order then by last name, then you would need an index that had postal code as first priority and then last name as second priority. Your printout would then look something like table one.

"Build it Right, Sell it for less."

Table 1

This could be very handy if you had a large mailing list and you wanted to print mailing labels in order of postal code so that you could take advantage of bulk postal rates.

The other problem that arises regarding keys is in how many the system allows you to keep for each file at a time. For example, if your package only lets you keep one index file for each data file then you would have to re-sort your entire database with a new key index in order to have a report that puts stuff in the order you want. On the other hand if the software lets you keep several key index files for each data file then you need only sort out a new key file and not have to re-sort your whole data base. Sorting out key files is much faster than sorting a whole database.

Finer Points

Now that you have an idea of the basic differences to be found in DBMS software we can take a look at some of the more subtle features that you might want to include in your purchasing decision.

The first extra feature you might wish to consider is the ease by which you can program your system. Many of the best packages are actually programming languages that you must learn in order to get the things you want done to work. Other systems have menu-like structures that eliminate the need for you to learn a new language or to generate code yourself. Most... but not all... of the most powerful and flexible systems do require you to take up this tedious task. It is still much easier than having to write the whole thing in something like BASIC or PASCAL.

Some systems, like dBase II, have accessory programs that let you just run through a menu to set things up. The accessory program then takes care of writing the code. One of my favourite packages is called Infostar by Micropro. This program lets you type stuff on the screen, just like you were using a word processing program, and then it generates all the code to make the program run the way you want. This has enabled me to set up new applications in a matter of minutes instead of days.

Many DBMS programs give you the ability to define how the data is entered and what data is allowed to be entered in which fields. For example, if you have a phone number field then you don't want people entering letters instead of numbers. Many systems will let you specify that in this field you can only enter numbers. Some systems get very fancy and let you place edit masks over fields so that you can define what is allowed into each separate space within a field, including different kinds of punctuation marks.

A good report generator is another very important tool in a DBMS. I once heard a wise sage say that "the data is only as good as your ability to get it out and fool around with it." The same criteria that apply to the files and data entry apply here. Some report generators are relational and allow you to use several files at once for input into your report. Others have limits on the number of fields they allow and how big each can be.

The ability to do most mathematical calculations, Boolean logic and string manipulation can increase the usefulness of your reporting. If you don't like listening to your printer clattering away then make sure the package you buy lets you run reports on your CRT as well as on your printer.

No matter how much we try to plan ahead when we set up a database, we always seem to have to add or subtract a field at some point down the road. With some of the less sophisticated programs on the market you could be stuck retyping all your old data into a new form. That is probably not what you had in mind when you decided that a computer should save you time and hassle in solving your data management problem. The solution is to make sure that you buy a package which will give you some way to change your mind later on. You must be able to have your computer move the data around so that it will fit the new form.

In a business situation, it is not uncommon to need the ability to have someone enter data on the computer and then to feed that data into your main file at a later time. This is called *batch processing*. You may want to have someone go over this data as it is merged to be sure that it is correct. This is called *batch verification*. If such is the case then be sure that this feature is available before you hand over your beaver skins to the salesman.

The Final Printout

In summary, I would say the really important things to consider in choosing a database package are the size and number of fields the thing will handle, whether the software is relational or a file manager, whether the data is stored as fixed or variable length records, the number of index files the system permits for each data file, the amount of control the user has over the field data types, the complexity in setting up a database and finally what the package costs and how much support is available to its users.

As I have stated before, my bias is towards a certain package because I use it a lot and know how to make it dance to almost any tune I want. That doesn't mean that it, or any other program, doesn't have drawbacks. They all do and what you have to decide is what do you want the system to do and can you live with the flaws of the system that comes closest to doing what you want at the price you will pay. It is a tough choice but if you know what questions to ask you will save a bundle of frustration later on.

Turbo PASCAL

One often sees advertisements for amazing language packages. Thirty or fifty dollars will bring you this unspeakably advanced Pascal, C, BASIC or other compiler which has splendid documentation and runs so fast that several laws of physics are violated on every compilation. Here's a look at one of these... which actually does what it says.

by Brian Greiner

I love Fortran. There, it's down in print for all to see. I've tried other programming languages, but Fortran remains my favourite. For one thing, it's easy to use. But best of all, it's a compiler . . . that means the final program runs quickly. And the documentation, in the form of books and standard libraries, is second to none. I will admit that it does have certain weaknesses, but it was my first computer language and none have ever been able to take its place.

Real Programmers use Fortran.

Yeah, but . . . There was this ad in a magazine that said "Send us your \$49.45 and we'll send you a super hot Pascal plus a spreadsheet program written in our implementation." Well, I've always wanted to see how a spreadsheet program is written, so I sent them my money. A couple of weeks later, the post awful brought a package to my door.

Ripping open the package, I discovered a book called the "Turbo Pascal Reference Manual" . . . a real book, this, printed on good quality paper stock and bound. This was accompanied by, of course, the inevitable floppy disk. I put the floppy into my system, read the bare minimum of instructions and decided to compile the spreadsheet program.

The results, and my ensuing forays into the powers of Turbo Pascal, were a general re-assessment of what you can actually get through the mail for fifty dollars.

Turbulence

The first thing I had to do was to run an installation program to tell the compiler what sort of terminal I had. Seems that there was a WordStar like editor built into the compiler which had to be installed, much as does real WordStar. I was beginning to wonder what this was leading up to. Like I mentioned earlier, I didn't read too much of the book at first . . . real programmers don't need documentation.

Eventually I started up the compiler itself and got a shock. A menu appeared on the screen! Well, I followed the instructions that came with the spreadsheet that told me what to do and after a brief interlude of disk crunching a COM file was spit forth. The spreadsheet worked fine but I didn't play with it too much, as the compiler itself had caught my interest . . . despite my deep rooted conviction that FORTRAN was the only language suitable for real programmers.

It turns out that Turbo Pascal is actually a totally interactive programming environment. Within this environment, one can edit,

compile, run and save programs. If an error is found during compilation an error message comes up and the user can then go into the editor mode directly to the spot where the error occurred. This makes debugging, at least at the compiler level, wonderfully easy.

The editor itself is modelled after WordStar, and produces a standard CP/M file with a carriage return and a line feed after each line. If desired, the editing commands can be modified during the installation process.

The transcript of a session in figure one gives some idea of what the Turbo Pascal programming environment is like. The program is an example from the reference manual. It doesn't really show what using the system on a CRT is like, though . . . especially the interactive facets of the editor.

As well, note that the compiler has several options. It will put the compiled file directly into memory, generate a COM file on disk or generate an overlay type file. The arrow shows which compiler option is in effect. Compiling into memory is the fastest of the three and is useful for a quick check of a program.

The editor uses most of the standard WordStar commands including cursor control, block commands, insert and delete

**NEW FROM
MAXISWITCH™**

The finest most cost effective keyboard for the IBM™ PC or the APPLE™ that we have ever seen. The IBM model has all of the standard features of the IBM KB plus an improved return key for true typewriter emulation (For word-processing) Full N key roll-over, auto-repeat and more. The APPLE version has a lot more than the run of the mill APPLE keyboard, 10 function keys, cursor pad, numeric pad, and 21 preprogrammed commands to save a lot of typing. Just like the picture and just as pretty.

ONLY \$199.00

Please specify APPLE, or IBM PC, XT
NOTE: Complements our IBM look-alike case exactly.

commands and find and replace. It requires that the entire program being edited be loaded into memory. This restricts the size of the program being edited to the amount of free memory space available . . . but there are tricks to circumvent this restriction.

The first trick is to break the final program into chunks and integrate the chunks during the compilation. This is done using the "I", or *Include*, command. This option allows the user to create libraries of frequently used routines that can be easily referenced by other programs.

The second trick is to use the CHAIN and EXECUTE commands to execute other programs from within a Turbo Pascal program. The CHAIN command can only ex-

. . . closely follows the standard Pascal defined by Jensen and Wirth . . .

ecute programs compiled with the cHn file compiler option . . . see the sample session. Variables can be shared between the current program and a chained program. The EXECUTE command is used to execute any COM file, but data cannot be shared as in chained programs.

Turbo Pascal closely follows the standard Pascal defined by Jensen and Wirth in their book "Pascal User Manual and Report." There are a number of extensions to enhance the usefulness of standard Pascal, including bit and byte manipulation, direct access to memory and data ports, dynamic strings, free ordering of sections within the declaration part, full support of operating system facilities . . . for example, the CP/M user is allowed access to the BDOS . . . in-line machine code, random access data files, type conversion functions, absolute address variables, *Include* files, program chaining with common variables and structured constants.

Hardware and Furniture

My first exposure to Pascal was with standard Pascal run on a large machine. Borland has turned a mediocre megacomputer language into a useful tool for microcomputers.

The manual, as mentioned earlier, is a soft bound book. It has two hundred and sixty pages, a good index, lots of examples

and is extremely well written. Although it is meant as a reference manual and not an introductory text, quite a bit of how to program in Pascal can be learned from it.

The version of Turbo Pascal which I use is for CP/M-80 but there are implementations available for Apple CP/M, CP/M-86, Concurrent CP/M-86, MS-DOS and PC-DOS. The cost for any version is \$49.94 US.

There is one catch in all of this. To quote the licensing agreement, "The license is limited to using Turbo Pascal for development of programs for use on one CPU only . . . It is thus illegal to give away or resell Programs developed using the Turbo system..." For those that wish to give away or sell programs utilizing object code generated with Turbo Pascal, there is a one time fee of one hundred dollars U.S. There are other makers of compilers that demand a royalty for each copy of a program written in their language sold and others that charge thousands of dollars as the one time fee so I suppose that a hundred dollars isn't too out of line . . . except that Borland's ads do *not* mention that the compiler is sold for use on a single computer only and that a fee is required for the sale of programs.

As it stands, even putting a copy of a program's compiled object code in the public domain would, strictly speaking, be illegal.

However, for the single user who wants to write programs for his or her own applications, Borland's Turbo Pascal is an excellent product, with lots of useful features. I'll even go so far as to say that real programmers use FORTRAN and Turbo Pascal.

Turbo Pascal is available from Borland International, 4807 Scotts Valley Drive, Scotts Valley, California, 95066

The New Printers

Printers used to be extremely dogmatic... you had a choice between cheap and nasty matrix beasts and high class daisy wheels. Now, however, technology has conspired to muddy the waters.

By Kevin Fraser

If you had enough money you could go and buy, oh, a laser printer or one of those huge page deals that can defoliate half of Quebec in a single afternoon of gobbling paper. However, one of the tenets of micro computers is the efficient use of one's resources and, as such, one always winds up looking for peripherals which do as much as possible for the bucks splurged.

A while ago it was pretty well required that one choose between the two basic

styles of printer. You could have a fast, moderately expensive... but ugly... dot matrix machine or a slow, extremely expensive daisy wheel that would output type actual humans wouldn't mind looking at.

It wasn't uncommon to have two printers if one could afford them, and a small cottage industry grew up around various forms of switch boxes.

Owners of those switch boxes may once again have a spare jack available, as the latest printers to spring forth have new aspects to them that make them a bit schizophrenic... they can be several things at once.

Here's a look at a few of them.

Type Casting

A fully formed impact printer gets its name from the way it makes a character on paper. This is essentially the same technique a typewriter uses. Daisy wheel printing looks exactly like a typewriter's.

Dot matrix print looks like a coarser version of the character display on your video screen. While it's become acceptable for use between "inside staff"... and other

computer users... it looks mass produced and rarely fails to make real humans think that you're mechanical in some way.

Figure one shows some samples of what the print from one of the latest generation of dot matrix printers looks like. Just reading through this type of print once will fool most people into thinking it was done up on a typewriter.

This is what the ads call "letter quality dot matrix."

Most dot matrix printers have a little bit of software on a small ROM in their innards. The reason for this is because the designers of such things, themselves true computer freaks at heart, saw that with the arrangement of printer pins they had to work with, they could make the printer do the letters in many different ways.

By changing a few parameters in the algorithm that forms the characters, the machine can come up with compressed or expanded letters, sub or superscript letters, italics, bold print, underlining, or almost any combination or permutation thereof. It will even do true proportional spacing if told to do so. Proportionally spaced type is set up

CRITICALLY ACCLAIMED

ACCOUNTING SOFTWARE FOR CANADIAN BUSINESS.

THE  FINANCIAL REPORTING SYSTEM

“

"I spent 5 months doing research on accounting software. Now I feel confident that I have the best available software for micro-computers and that all my customers' needs will be met by the NFC accounting software."

-- M. Nowak-Gilmore, Business Consultant
MY Business Services (Kingston)

"It is refreshing to work with a company that is concerned about your problems and endeavours to solve the most minute difficulties as quickly as possible.

. . . It (the software) offers many features that have been useful for our personal needs, especially the data base management system and report writer."

-- Brian Davis, Tech. Support Technician
Anderkoch Institute of Data Processing
(Kitchener)

"I would like to commend your company for producing the New Frontiers Accounting System. It is truly a user friendly system which allows great flexibility and power for catering to the particular needs of each client. The fact that your company provides customization services further emphasizes this point."

-- Les Nip, Partner
The Software Center (Toronto)

"NFC has really helped me stay on top of my business. I'm getting complete statements on demand, and have full control over my receivables . . . The report writer allows me to create special client reports . . . a versatile system."

”

-- Michael J. Dymont, President

The New Printers

so that each letter takes up only as much space on the line as its width justifies, so that you would get quite a few more characters in a line of "i" characters than in one made up of, say, "m". Proportionally spaced type looks a lot nicer.

The new dot matrix letter quality printers are actually smart enough to do the proportional spacing themselves. All you have to do is tell the printer in advance that you want it to justify the text you're going to send it, tell it the length of line you want it justified to, send it the line of text and it will figure out how many letters should go in each line and so on, inserting the correct number of microspaces to "pad" the line out to the length you specified initially.

Many letter quality dot matrix printers have what are called letter quality and draft quality print modes. Draft quality is actually a compromise that allows you to get the document printed out quickly when you are more concerned with the time it takes to finish than with the appearance of the print.

Draft quality is essentially a dry run of the final printout that can be done at high speed with no frills. It's unspeakably handy if you are doing a table or chart or something that has to be carefully formatted, and you need to test the way it looks on paper. In draft mode, the Toshiba P1350 printer will do one hundred and sixty characters per second. Although it won't look like a typewriter did it, you'll have it on a scroll right quick.

Having proofed and otherwise looked at your draft, you can edit your text files and run it all through again, this time in letter quality mode. This looks nice, although the work will take longer. The P1350, for example, goes at a hundred characters per second.

A Bunch of Flowers

Even with all the advances in dot matrix printer quality these days, there are still those diehards who insist that the only way to get real daisy wheel quality print is to use a real daisy wheel printer. The alternative would be a typewriter, except that typewriters don't score very well in the high tech department.

However, anyone who uses a word processor for routine correspondence will tell you that there are times when it's just plain quicker to type up a label, or a list, or anything short and sweet and one shot like that, without having to use the word processor to create a file and print it out.

A printer is a typewriter that takes orders from a computer, instead of a keyboard. However, there are a rash of new printers available that can be convinced they are actually typewriters in disguise. You can use these things as either manually operated typewriters or computer driven daisy wheel printers.

There are several variations on this theme. The most common systems are daisy wheel based, like the Smith Corona Ultrasonic III Messenger and the Olivetti ET 351. However, there is also a dot matrix system from Brother, the EP-22.

The Smith Corona Messenger is a typical dual perspective printer. It has a well engineered keyboard, even by a typist's standards. It is a correcting typewriter,

-24.5	-21.8	-18.9
-9.8	-8.7	-7.5
-14.7	-13.1	-11.3

Cashflow Impact

Figure two. Draft quality print at one hundred sixty characters per second.

which means you can back up to the place on the paper where you made the mistake, white it out and then type over it with just a few keystrokes... without having to breathe the mind altering fumes of liquid paper. It uses replaceable daisy wheels so its print fonts can be changed to suit the occasion. It does very crisp looking print.

There are a few peculiarities inherent in this sort of machine. Having evolved from a typewriter, it features a typewriter's character set. So, for example, it can't do greater and lesser than symbols, substituting a one half symbol and cents for these codes. This would be a bit of a drawback in, say, printing BASIC listings.

The basic design components are pretty much the same regardless of manufacturer. One generally needs an interface between the computer and the printer... this may take the form of an external box or a card inside the printer itself. There'll be some mechanism for telling the machine what you want it to print from... the computer or its own keyboard. The SCM accepts control P as a toggle for this function, although some of the printers have a mechanical switch.

The Brother dot matrix printer typewriter probably deserves some mention. At the very least it's unique. It runs on AC power or four flashlight batteries, and has a two K RAM buffer, allowing it to do things like repeat the same letter over and over again. If you are using it in its typewriter mode there's a fifteen character liquid crystal display in there to permit one's type to be eyed before it lands on the page.

While small and convenient, the Brother does lack some of the finesse of the larger machines. Its dot matrix type is extremely coarse, and doesn't provide for true descenders... the little tails on lower case letters that hang below the base line.

Brother also has a rather extensive line of typewriters that can be convinced they are printers. The higher end of the spectrum includes such beasts as the EM-80 which sports options like cut sheet and tractor feed mechanisms. Their CE-70 machine sports eight kilobytes of memory and an optional disk drive. Both of these machines can be connected to somebody's computer with an optional printer interface.

Olivetti has also stepped into the typewriter printer arena with their 'ET' line of office products. Their basic line of printing machines all have civilized keyboards and an interface that's installed inside the machine by your dealer. These are pretty ample devices that include two communications channels.

Olivetti also has an under one thousand dollar daisy wheel printer called the *Praxisprint*. It offers print in ten, twelve and fifteen characters per inch, a maximum line length of eleven inches and a print speed of twelve characters per second. Its purchase price includes Centronics, RS-232 and Commodore 64 compatible interfaces all in one box.

End Of Job

You may be thinking about a dual mode printer for economic reasons... many of the cleverer ones can save you a lot. One of the typewriter printers might solve a desk space problem. The extreme flexibility of the letter quality dot matrix machines often appeals to hobbyist users... there's just so much in there to meddle with.

As the cost of printers has decreased and the competition for a place in the maelstrom of computer shops has gotten nastier we've seen a lot of innovation like this. To be sure, it hasn't ended yet. However, there has never been a better time to go shopping for a printer. You don't have to settle for something that doesn't quite meet your requirements if you don't want to.

C64 Peripheral Survey

By itself, the Commodore 64 seems to hold up fairly well, but stuff its I/O ports with some peripherals and you'll not only have a better machine, but it'll be waterproof as well.

The Commodore 64 has come a long way since its introduction in 1982 as a more memory efficient alternative to the VIC-20 with no software and a fairly hefty price tag. At present, software abounds, its price is in the four hundred dollar range, and a great deal of peripherals are now available to correct hardware omissions or generally enhance the machine in general.

Naturally, I/O is important to any computer and generally strengthens the computing power the machine affords the user. Pointing devices, like light pens, graphics tablets and joysticks offer an alternative to keyboard-user interaction. Eighty column cartridges make word processing a pleasure, and a CP/M option brings an entirely different operating system to 64 owners.

This survey, then, encompasses most of the useful additions one can make to one's 64.

Commodore 1541 Disk Drive

Description

A single sided drive that formats disks at thirty-five tracks of between seventeen to twenty-one sectors per track. Formatted disk capacity is one hundred and seventy K. The 1541 contains a microprocessor and a two K RAM buffer.

Manufactured By Commodore

Available From

Local Commodore dealers

Price

\$399.95

MSD Super Disk Drive

Description

An alternative to the Commodore 1541. The drive's disk controller has its own microprocessor. Formatted disk capacity is one hundred and seventy-four K. Disks are formatted at thirty-five tracks of between seventeen to twenty-one sectors per track.

Manufactured By MSD

Available From

International Marketing Services, Inc.

Price

\$650.00

MSD Super Dual Disk Drive

Description

This disk drive offers two drives in the same package. Both drives can operate independently, or as a single unit. The formatting and microprocessor are similar to that in the single drive unit.

Manufactured By MSD

Available From

House of Computers, Inc.

Price

\$1095.00

Koala Pad

Description

As a graphics tablet, the six by eight inch Koala Pad provides a four inch by four inch drawing area. A plastic stylus accompanies the tablet, as does "The Micro Illustrator", a utility graphics program. The Commodore version of the program allows copying selected portions from one picture to another, and an "undo" feature. Other programs supporting the Koala Pad are available.

Manufactured By

Koala Technologies Corporation

Available From

Mr. Software

Price

\$110.00

Commodore Joystick

Description

The Commodore joystick has five bubble switches; four directional and one under the fire button. The "stick" is covered with a synthetic rubber coating for comfort.

Manufactured By Commodore Computers

Available From

Electronics 2001

Price

\$19.95

Wico Command Control Joystick

Description

Wico joysticks have six leaf-type molded switches and two switch selectable fire buttons. This standard model provides a long, bat handle grip with smooth action.

Manufactured By Wico Corporation

Available From

Mr. Software

Price

\$29.95

Cardkey/1

Description

A separate sixteen key pad that plugs into a joystick port. Each key is programmable, either in values or strings. A "calculator" mode is offered where it is unnecessary to type PRINT before making an on-screen calculation.

Manufactured By Cardco

Available From

Computer Workshops Limited

Price

\$69.95

Wico Three-Way Deluxe

Description

This joystick offers a choice in hand grips. Three are supplied including the standard and the power grip handles. As above, two fire buttons and six switches are inherent.

Manufactured By Wico Corporation

Available From

Mr. Software

Price

\$39.95

Wico Command Control Trackball

Description

A phenolic ball allows three hundred and sixty degree movement in this game control unit. The device itself isn't much larger than one's hand. One fire button is provided in its upper left hand corner.

Manufactured By Wico Corporation

Available From

Mr. Software

Price

\$34.95

BusCard II

Description

An improved version of the BusCard, the BusCard II has a parallel and serial port, as well as a slot for cartridge software. The BusCard adds extended BASIC and a machine code monitor to the Commodore 64, as well as the capability to switch from PETASCII to ASCII.

Manufactured By Batteries Included

Available From

Batteries Included

Price

\$195.00

C64 Link

Description

The Link allows the Commodore 64 to transfer data from any device to another, be it serial, parallel, or IEEE. BASIC 4.0 is resident, and the Link gives the 64 a machine language monitor.

Manufactured By Richvale Telecommunications

Available From

Richvale Telecommunications

Price

\$185.00

Cardboard/5

Description

The Cardboard/5 is a five slot expansion bus for the 64. The unit is fuse-protected, has twenty-two L.E.D.s for status indication, and is completely switch selectable. A reset button is provided.

Manufactured By Cardco

Available From

Computer Workshops

Price

\$109.95

Data 20 Z-80 Video Pak

Description

The Z-80 Video Pak offers the 64 both eighty columns and the option of a CP/M operating system. SB80, written by Lifeboat, is inherent in firmware. At present, over fifty CP/M programs are available for this cartridge including WordStar and dBase II.

Circle No. 14 on Reader Service Card

Hayes

Your Apple's telephone.

"Thanks for the prompt reply. Sure was a lot faster than waiting for the mail!"

"Gary: The pedigrees for next week's auction are as follows..."

"Attn. Prod., Sales, Purch.: Recommend 50% blue, 30% red screen for closest match!"

A complete plug-in communications system for Apple® computers. From Hayes, the established telecomputing leader: the simple but sophisticated Micromodem II™ plug-in board modem and its companion software, Smartcom I™. Everything you need to expand the world of your Apple II, IIe, II Plus and Apple III. In one, convenient communications package.

With Micromodem IIe and Smartcom I, you can access data bases, bulletin boards, and the varied resources of information services. Plan your travel itinerary via computer, including flight numbers, hotel and rental car reservations. Retrieve and analyze daily stock and options prices. Work at home and send reports to your office. You can even do your gift shopping by computer!

Micromodem IIe. Think of it as your Apple's telephone. It allows your computer to communicate with any Bell-103 type modem over ordinary telephone lines, at 110 or 300 bits per second. Micromodem IIe installs easily in an expansion slot, and requires no outside power source. It connects directly to either a single or multiline modular phone jack, to perform both Touch-Tone® and pulse dialing.

Micromodem IIe dials, answers and disconnects calls automatically. And, unlike some modems, it operates in full or half duplex, for compatibility with most time-sharing systems.

A built-in speaker lets you monitor your

calls when dialing. That way, you'll know if a line is busy. With Smartcom I, Micromodem IIe automatically redials your last number.

Discover how Micromodem IIe can help maximize the capabilities of your Apple. While Smartcom I software will minimize your efforts.

Smartcom I companion software. For effortless communications. Whether you're a newcomer to personal computing or a seasoned professional, you'll appreciate the ease and speed with which you can perform any communications function. Thanks to Smartcom I!

Let Smartcom I guide you through a few easy-to-answer questions to tailor the program to your particular needs. Then you're ready to go!

Make a selection from the Smartcom I menu to manage your communications, files or printer. Program prompts guide you along the way. And menu selections let

you easily make a call, end a call, or answer a call. When you're on the receiving end, your Micromodem IIe answers automatically, even if you're not there!

Convenient! And so is the Smartcom I memory for phone numbers. Smartcom I stores three of your most frequently called telephone numbers and one prefix. Plus, it remembers the last number dialed.

Smartcom I also provides a directory of the files stored on your disk. And lets you create, list, name, send, receive, print or erase files right from its menu.

Smartcom I is as versatile as you need it to be. It accepts DOS 3.3, Pascal, CP/M™ 3.0 or CP/M Plus™ operating systems. And accommodates up to six disk drives and several printer interface cards.

Like all our products, Smartcom I and Micromodem IIe are backed by excellent documentation and full support. Including a two-year limited warranty on Micromodem IIe and a 90-day warranty on Smartcom I!

See your dealer today. Then plug into the exciting world of telecomputing.

Morrow Review

The Morrow MD11 combines some fairly well debugged technology with extremely sophisticated, well human engineered software. The result is a powerful system with an unusually rich array of features.

by Steve Rimmer

It's interesting to note that, while almost all of the high end business computers to have been released of late have been IBM compatible machines, there are still a few CP/M based boxes coming out. What makes it worth looking at is that the power of these new computers is, for some applications, actually greater than that of an 8088 based machine. Despite the apparent restrictions of filthy old prehistoric eight bit chips, some of these newer computers can access a quarter megabyte, run at six or eight megahertz and blast away at their disks with unparalleled speed.

The Morrow MD11 is one such beast. It uses a Z80A to think with, one hundred and twenty eight kilobytes of memory to hold its resultant thoughts and an eleven megabyte hard disk to ultimately place them in the files of destiny. There are also three RS-232C serial ports in there, one Centronics type printer port, one RS-422 high speed serial port... we'll get to all this in a second... and a double sided double density floppy drive. It runs the new and improved CP/M 3.0 or CP/M Plus.

It's only recently that the advertising agencies, so long responsible for marketing paper towels and tooth brushes, have been turned loose on software products.

In addition to all of this the Morrow comes with large fuming piles of software. Included is NewWord... which is essentially Wordstar with some cosmetic changes... Correct-It, a spelling checker, the LogiCalc spreadsheet package, Personal Pearl to manage data bases, Quest to balance the books, MBASIC, BAZIC, which is a version of Northstar BASIC, PILOT, some disk utilities and a very powerful menu structure.

However, one of the things that makes the MD11 a bit unique is that it does not come with a screen and keyboard. While experienced users may be able to converse with it using a doorbell and a light emitting diode jammed into one of the communications ports, most will need a terminal. This is, essentially, a keyboard and monitor package which can send characters to and from the MD11 over the communications port. See the March '84 edition of CN! for an explanation of what these things are all about.

The whole mess, when flung together in the same room, is a really splendid little machine. The extent and nature of the splendor follows.

Three's Company

The operating system of the MD11, CP/M 3.0, is what gives the machine a great deal of its character. While it can behave in much the same way as normal CP/M 2.2, it has a number of additional features.

To begin with, it allows the Z80A to actively utilize the eighth of a megabyte of RAM in the system. Software which tries to access the upper sixty four K block causes the operating system to do the bank switching required. As such, much of the software really thinks it has all that memory to play with.

This much RAM makes quite a number of the limitations which are inherent in sixty four K machines pretty meaningless. Most of the memory hungry applications one finds on micros, like spreadsheets and such, seemed to be unstoppable on the Morrow.

Users who are familiar with CP/M 2.2 will find that most of the same commands do much of the same stuff on version three. However, if you aren't into all this technical stuff you don't have to worry about PIPs and STATs and the like because the Morrow comes with... PILOT!

Now, if you've been following Computing Now! you'll have read Doctor Evans' article in the August '83 issue and will be wondering what it has to do with CP/M 3.0. Well, in fact, the answer is that it nothing to do specifically with it, but that there are some pilot programs included with the Morrow system that do. In fact, for reasons not fully explained in the voluminous documentation which comes with the system, the Morrow comes with an implementation of the PILOT language and a number what it calls *co-pilots*. There is a school of thought which has it that they came up with the co-pilot idea first and picked the language 'cause it let them use this clever name.

When you first boot the MD11 it runs one of its co-pilots... which sets up all the software. This means that it takes each of the major packages and installs it to your specifications. It even puts your own personal name in Personal Pearl. Ah, well, it does if you tell it what your name is, anyway. I hadn't cracked the manual by the time I got to this aspect of things so that when it asked me my name I did what any normal denizen of a government oppressed society would do. Personal Pearl thinks I'm King Arthur of the Britons.

This installing co-pilot takes about five minutes to do all its stuff but it saves days of the software installation drudgery that usually accompanies getting a new computer. As we get them on a rate of about one a month, it was really splendid to watch the whole ordeal stream by unattended.

The Morrow is, unquestionably, the easiest system to get up and running of anything we've seen thus far. Its hard drive comes stuffed with software, its installations are all androidal and when they've stopped twitching it launches you into... another menu.

The main co-pilot is booted upon powering the machine at any time other than the first run. It's menu driven, giving you access to the large software packages, the system's utilities and low level functions and, if you feel a need to, to CP/M itself. While it can be disabled for seasoned users, it's actually a great deal more user friendly than anything the little pointy arrow prompt could ever do for you.

For example, to move a file from the hard disk to the floppy drive from the menu one would simply select the utility sub-menu, the file movement option and enter the file name and its destination. At the CP/M level you'd have to use PIP with all its file specs and toggles. CP/M 3.0 PIP has

rather more toggles than one might be used to using.

What You See

One of the finest aspects of using the applications software which comes with the Morrow is not in the software at all. It's a function of the way the computer is structured to deal with reality.

Most micros are, in fact, a computer and a terminal in one, and most computer users never have to make the distinction between the two. The MD11 is just a computer. It has no screen or keyboard... but it does have a serial port to hook a dedicated terminal to.

Terminals are really wonderful things. Even fairly inexpensive ones will generally have orders of magnitude better keyboards and screens. As such, the Morrow is a really decent thing to work at. In addition to just being really slick, this separate terminal aspect of things allows you to select a terminal which you like the feel and look of,

The computer itself is the box with the disk drives. The keyboard and screen are actually the terminal.

Morrow Review

Table 1

The following are a number of terminals which are suitable for use with the MD11. Others will work as well... check them out for compatibility first, though.

Morrow MDT 60 and MDT 70
 ACT 5A
 ADDS Viewpoint
 DEC VT52 and VT100
 Hazeltine 1450 and 1500
 Heath H19
 IBM 3101
 Lear Siegler ADM 3A, ADM 5, ADM 22 and ADM 31
 Qume 102
 SOROC IQ 120
 Teleray
 Televideo 910, 912, 920, 925 and 950
 Visual 200
 Wyse

rather than being stuck with what the boys at the factory felt was state of the art.

Morrow, of course, does make a terminal, and you can get the whole thing in one shot if you like their stuff. Table one lists some of the other options.

The first thing I tried on the Morrow after the disks stopped spinning was the NewWord word processing program. It's extremely like WordStar, inasmuch as all the same control codes apply to it and it acts in very much the same way as WordStar. As the story goes it was done by an ex-alumnus of Micropro, the company that does real WordStar.

The disk organization of the Morrow is such that the disk has sixteen user areas. These are simply file designations... if you say that a program is in USER 1 it can only be seen if you are logged into user area one. The system uses this feature to keep the disk directories of the hard disk down to a manageable hugeness. All the applications programs are in USER 0. The next three hold the files generated by NewWord. Higher user areas are given over to files from the other applications packages.

If you sit in front of the Morrow with NewWord running and pretend you are using WordStar you will virtually never make a mistake. The commands are identical. NewWord may be somewhat faster... it's hard to say if the relatively snappy response of the computer is a function of the software or the machine itself. However, to be sure, everything WordStar can do can be handled by NewWord at least as well.

There are a few advantages to the program, primarily for the new user. The menus are a lot less cluttered, for one thing. However, what really does it for NewWord is its immense manual.

The manual which comes with WordStar is a turkey of the first rank. If you are

halfway into computers before you start with the thing you can learn the software entirely from the menus, which is probably for the best. If you are bit lost, WordStar's book will send your brain into a lower astral plane.

NewWord's manual is quite the opposite. It's excellently done, explains everything you want to know, walks you through things fairly painlessly and even has a decent index. There's a thick glossary of terms at the back, too, which makes looking stuff up pretty simple. For more advanced users the book provides source code for the patchable areas of the program exactly as does Wordstar version 3.0.

Multilingualistics

The MD11 system comes with three programming packages.. four if you count the CP/M ASM assembler. The most common of these is MBASIC, or BASIC-80 from Microsoft. It is a very powerful disk BASIC with all the good stuff expansive BASIC packages are meant to have in them. It comes with a very good manual exactly like that of every other system which comes bundled with MBASIC.

Microsoft BASIC, however, is considered by many users to be slimy and unworthy and, as such, the Morrow package offers alternatives. The first is Micro Mike's BAZIC... complete with a Z. While still a BASIC interpreter, it has a number of marked differences from old BASIC-80.

The most important advantage in using BAZIC over MBASIC is that the former is written to run on a Z80 rather than an 8080, as is the case with MBASIC. To get technical for just a moment, a Z80 is a newer and niftier chip which supports all software written for the older 8080. However, if you write code using the additional features of the Z80 you get much faster, tighter stuff... although it won't run on 8080 based systems.

BAZIC, then, is one of the fastest BASIC interpreters available. It is, in fact, an implementation of Northstar BASIC, which, of course, means that it won't run MBASIC style programs without modification. However, it is an interesting and powerful language with many facilities the Microsoft implementation just doesn't provide. It also lacks some that it does... you gives and gets in these things.

Finally, we have PILOT. This will be the weirdest of the three for most users. PILOT is essentially a language for educators.

While not ragingly powerful it does program easily and quickly.

In fact PILOT is one of the simplest things in the world to write code for. It is an interpreter like BASIC... although it has no line editor, so you must compose your PILOT programs with the word processor, just as in the case of compiled languages. Its syntax structure is insanely simple, with everything being hung on input and output.

PILOT is the ideal thing to write menus in. Figure one shows some of the code used in one of the Morrow's menus. The symbol T: means to type the line, analogous to the BASIC PRINT. If you can't write programs in PILOT you have probably crashed your brain ages ago.

This all means that the system is profoundly flexible without being laden with

complexities. Using the PILOT manual which comes with the Morrow even programaphobes will be able to word process themselves new menus or alter existing ones. Thus, for example, if you buy new software for the system you can go in and add it to the menu.

Furthermore, and perhaps most important, you can actually say you know how to write programs... in a dialect few of your friends are likely to know.

Morrow Morrow Morrow Your Boat

There's actually quite a lot more that could be said about the MD11. However, when one encounters a phrase like this in an article one can be pretty sure that it isn't going to be.

The MD11, while simple to use and really a trip to work with is also amazingly complex once you get over your initial fear of the thing. You may never need to get into its works, but if you do you'll find that the support that comes with it is second to none. Its design and general architecture is inspired and its construction is solid. It's just a fine lump of fiberglass, y'know...

The MD11 is probably one of most useable business machines around. At \$4295 for the system and the terminal it isn't in the financial class of Max's Fly-Bi-Nite Apple clones, but if you've been looking for a medium priced business system and can relate to not owning a computer personally endorsed by Charlie Chaplin's ghost the Morrow is among the better things to check out.

Argh, Billy...wake up me lad... the PILOT's drunk an' there be menus all over the mizzen mast...

The Morrow MD11 and other decent computer-like phenomena are available from Micro Bazaar, 23 Westmore Drive, Unit 5, Rexdale, Ontario 1-416-745-4740. The system is also available without its terminal. The terminal costs roughly six hundred and twenty-five dollars. CNI

SELF-CONTAINED EPROM COPIER/PRO-GRAMMER

- Includes its own Z80-A processor
- Needs no personality module
- Copies: 1, 2, 4 & 8K bytes single supply EPROMs
- Comes with a powerful 4K bytes-monitor

ONLY \$99.00* (kit)

FREE

Call or write for your free copy of the products catalogue we manufacture

With this KBH interface, you can modify your EPROM content or load a new code in the PRO-GRAMMER's RAM before transferring on EPROM. You can also access several operation modes such as:

- Memory and register examine and change
- Insert/delete one or many bytes anywhere in a program
- Break point execution mode
- Block transfer mode
- and much, much more

ONLY \$59.00 kit

The Apple][Something

New Apples seem to be hurling themselves out of the orchard at a rate of about one a month these days. We actually got to talk to the great fruit picker himself about this one, though, a low priced sophisticated Apple II.

by Steve Rimmer

The King Edward hotel in Toronto is a really nice place. There's a clown out front with a top hat who opens the door for you, lots of marble everywhere and a variety of ashtrays to swipe in the huge lounge. The buffet is about ten bucks a head and, as it turns out, they won't let you leave a 1975 blue Chevy pickup in the parking lot.

At least, they wouldn't let me.

I don't smoke, so the ashtrays of the Ed never seemed to make it worth the trip.

However, on this particular day we'd had a call from Bill and Ed of Apple Canada's public relations agency saying that one of us could come down and meet Steve Wozniak and talk about fruits.

Steve Wozniak is the guy who built the first Apple. Myth has it that it came together in his garage. As it turns out, the site was the floor of his apartment. However, even given this lapse in credibility this seemed like a really decent opportunity to get a free lunch and find out about the rumours of yet

another new Apple soon to blossom forth.

The Two Something

The rumour went something along the lines of there being a new Apple coming out to be called the Apple IIc. In fact, as Wozniak sat at the large round table in his hotel room yarning about the history of Apple and the development of his newest fruit he refused to say what the letter after the name would be. It was the "Apple II something".

The new Apple, he said, was a development of a general rethinking down in Cupertino. Apple started out making the Apple II, and then the II+, and Wozniak maintained that a lot of the success of the company had been in that it had always supported its users. It had kept things compatible, so that Apple II+ owners, for example, would not be left behind by the introduction of the IIe, and so on.

However, there had been some corporate hassles as the company grew. The Apple III was released, and, although technologically Wozniak felt it was superior to the IBM PC it never really sold. This was followed by the brilliant concept of Lisa. However, Lisa failed to do what virtually everyone at Apple felt sure it would manage, to wit, make inroads into the very high end micro market, the 'Fortune 500' companies which are traditionally ensconced in IBM hardware.

The new Apple, then, was to be a returning to the things that Apple did best. Wozniak said that a lot of Apple's efforts have returned to eight bit microprocessor based machines of late, and to expanding their capabilities. The Apple II something would be the first of a number of Apples designed both for the home and business markets.

Wozniak spoke of new technological developments like the 816 processor, a chip which was created largely at Apple's request. It incorporates the complete instruction set of the 6502 but also has a sixteen bit set. As such, a machine built around it could run Apple II+ software as a straight eight bit computer would. However, it could also be a sixteen bit system, with all the power of, say a PC, using the superset instructions.

Such a machine, said Wozniak, exists in an advanced state of development in Apple's research facilities.

Something Else

The Apple II something, however, was very real. As the discussions came to a close Bill produced a yellow vinyl carrying case which looked like it could spit forth a computer. 'This isn't to be released until the twenty-fourth of April,' he intoned. He went on to swear everyone in the room to secrecy and explained at great length what

would happen to Ed and himself should anyone fail to maintain his oath. With trembling hands he placed the new system on the table.

The new Apple looks a bit like an Atari that has been run over by a truck. It's extremely small and almost weightless. It has a full sized QWERTY keyboard, one hundred and twenty-eight K of RAM and a single five and a quarter inch disk drive set into its right side.

'When we first built the Apple II,' said Wozniak, 'we figured that it was this... carryable. Thing is, when you got the monitor and the drives and some software under your arms... You can take this machine around on a plane and plug it into your hotel room TV.'

The system is, in fact, surprisingly self contained. It uses about thirty chips to perform all the functions of the Apple II+ plus peripheral handling, having more custom logic than did the IIe. Electrically it's very much like an Apple II+. However, there are no slots and most of the 'cards' are already in there.

You would use the new Apple exactly as you would a conventional one. The computer thinks that it has a printer interface in the memory space that would be slot one, a serial card in slot two, a disk drive in slot six, and so on. In essence, most of the Apple cards people usually buy are already hard wired onto the board... a slightly more sophisticated version of the enhanced Apple compatible systems which have emerged with fewer than eight slots.

The new Apple, then, has a built-in

parallel printer interface and a serial port. There's one disk drive included and a connector to allow plugging in a second external drive. There's also an RGB output to allow the computer to drive a colour monitor in addition to the usual composite video jack.

The system has a number of clever features. Among these are switches on top of the case which allow one to switch between forty and eighty column screens and to select an alternate keyboard layout. This will be of interest to users who want to compute in foreign languages... the North American version of the system comes with the highly weird Dvorak keyboard as an alternate.

The system also features the Apple IIe's double high resolution graphics, giving it a horizontal pixel count comparable with that of the IBM PC.

The new Apple will, among other things, be very low cost, said Wozniak, although he could not say what it would finally end up costing. It is intended for use by the home user who wants to apply a microcomputer to his or her activities. It is not an open system, like that of the traditional Apple II, so, while it is compatible with all existing Apple II+ and IIe software, it offers no room for hardware expansion. 'If you want to plug in a music synthesizer or you want to be able to use the very latest printer interface card you should buy a IIe,' Wozniak observed.

Twigs

As the first of a new harvest of apples the

Apple II something looks to be a very impressive machine. It appears to be easy to use, well put together and vastly less massive and awkward than the traditional Apple doorstep. Wozniak has great hopes for it. However, as he explained, Apple has had expectations of its products in the past which have not materialized.

In the development of the Lisa, for example, there came the creation of a unique disk system called the 'twiggy'. It was going to allow a megabyte and a half to live comfortably on a five and a quarter inch diskette, and, with it, Apple would have had the most powerful disk drive available. The money tree was half defoliated to pay for its development but, by the time it came to use it, it was outmoded and the Lisa wasn't selling.

'We have this warehouse with thousands of Twiggy drives in it...' said Wozniak, smiling. 'I think we're gonna take them all and make them into a sculpture in the Apple complex somewhere.'

Don't Shoot The Printer

Selecting a printer from amidst the throng of printers looking for homes is a bit like getting a cat from the humane society. Printers are no fun when you give them too much catnip. However.

If printers had wheels you'd swear they they were used cars 'cause all the people who have them and want to sell them seem to lie about them so often. Or, at least, they look to be out to confuse you. Don't you just love getting it home, getting it mired in its jungle of cables and having it spit air? You know that if you call the place you bought it from the guy will start with "...you didn't tell me you were going to put paper in it..."

Printers are fairly confusing. You probably bought your computer for fairly intelligent reasons... you *did* like the light-up keys, didn't you... but you will probably choose a printer on the basis of a combination of blind luck and witchcraft. That's okay, though... that's probably what they used to design it.

Printers are a heavy thing to get into all at once, which is why we put this article part way through the magazine.

by Steve Rimmer

Twins

Having at the basics, it should be noted that all printers do largely the same stuff. They make marks on paper. There are several approaches to this, which can be subdivided down into *practical* and *impractical*. Of the latter type, we have printers which are too expensive to contemplate, such as ink jets and lasers, and those which produce results which are substantially gross, such as teletypes and thermal printers. This leaves us with the former group which, not surprisingly, we're going to look at in this feature.

Practical printers come in two distinct groups, these being the daisy wheels and the dot matrix machines. Both work using the time

honoured tradition of smashing metal or plastic shapes through ink encrusted ribbons onto paper. The differences are in how fast they work, how nice their type looks and how much they cost.

A daisy wheel printer is essentially a glorified electric typewriter... without the part where you actually do the typing. Instead, it has a computer interface so that the characters sent down the wire at the machine will make the print mechanism hammer the paper with the corresponding symbols.

The thing about printers that imitate typewriters is that their speed is entirely a factor of how fast they can select a character... that is, the time it takes for the thing's feeble brain to say "hey, I'm done with that letter... let's go get the next one..." and then actually bring the printing hammer... or whatever... to bear on the paper.

This fact did not escape the three-eyed

Seiko Sport-Tech introduces DATA-2000 16 years before its time.

The personal data bank, calculator, phone book, appointment calendar, day/date digital alarm chronograph. With two big 1,000 character memory banks to store information in words and numbers—no codes, no languages to learn. For writing or calculating, the Data-2000 is placed on its own slim pocket-size keyboard. On the wrist, Data-2000 recalls information at the touch of a button. Welcome to the 21st century.

Don't Shoot The Printer

hunchbacked gnomes that designed these things. They figured out that the shortest distance between two characters was invariably round, as circular things can move faster than linear ones. Thus, printing contrivances are frequently circular. To this effect we have the IBM golf ball, the printing thimble and, finally, the daisy wheel.

There's a photograph of a daisy wheel on our cover this month. Each "petal" of the flower has a letter on it. To print a character the printer revolves the flower 'til the petal it wants is straight up and then mashes it forward with a small electronic hammer.

Despite the speed at which a daisy wheel can spin, it is still fairly slow in terms of the number of characters the printer can select in a second. There are actual reasons for this, most of them greasy and mechanical, but the result of it is that low cost daisy wheel machines clatter along at anywhere from twenty-five characters a second on down.

Dot matrix printers are more common than daisy wheels... largely because they are ultimately more useful for the things people use printers for. They produce characters in much the same way as your video monitor does... out of dots. A dot matrix printer will have a matrix of pins and a number of electric hammers to drive them. Internal logic selects the appropriate dots to form intelligible symbols.

Dot matrix printers, despite their apparent complexity, are cheaper to make than daisy wheels because most of their critical stuff is electronic rather than mechanical. Chips are cheaper than motors. However, more to the point, dot matrix machines are faster and more flexible.

Because of the way they work, dot matrix printers can clip along at a decent pace. The pins that impact with the print ribbon travel very short distances, and, as such, the time involved in printing a character is much shorter than that of a daisy wheel. More to the point, the time involved in selecting a character is entirely taken up in the internal logic of the machine selecting a character pattern from its memory... this is as close to no time as a mechanical thing can get. As such, dot matrix machines can buzz along at over one hundred characters per second without half trying.

The factors which determine the speed and attractiveness of dot matrix type are actually fairly closely linked. The quality of the characters produced by a printer is a factor of the number of dots in the matrix. A denser matrix will produce nicer type and... as is outlined elsewhere in this issue... a sufficient density can result in type which approaches the result of a daisy wheel printer. However, more pins also create more heat, and, as such, denser matrix printers must run slower.

The universe is like this. Maybe someone

will come up with one that's water cooled.

There are other aspects of dot matrix printers, however. The patterns of pins that get selected are a function of bit patterns stored either in a read only memory or in programmable memory within the printer. This means that the bit patterns can be changed, at least in theory. In fact, many printers will allow you to "download" characters of your own design, thus permitting the printer to print whatever symbols you feel like having on the page.

At the same time, the printer itself can contain multiple character sets. By simply changing what bit of its ROM it is looking at for its patterns the thing can go from doing regular type to italicized type to underlined type and so forth.

Finally, if the printer is sufficiently clever it can be used to print high resolution images on its page. Again, it is simply a matter of manipulating the pins in its print head. In most cases, the printer will use only one vertical row of pins in its high resolution mode, traversing the page in increments of one dot rather than one character. The eight bit characters sent to the printer are interpreted, then, as being the eight bits which determine which of the pins in the one active row will strike the paper.

Shopping List

Having ploughed through all this theoretical stuff let us proceed to check out some of the realities of printers.

If you look at the results of a dot matrix printer and then at those of a daisy wheel machine you'll probably be able to decide which of these sorts of printers is suitable for your application. It's a pretty clear choice between class and practical considerations. Can you afford to wait for your printouts? Is anyone going to take exception to dot matrix printing? These and other questions...

These and other questions are your own problem.

The practical considerations in buying a printer are more easily gotten around. Most of them are things you never think of... and many won't come back to haunt you until long after it's too late to return the thing.

The most obvious approach to buying a printer is to choose the cheapest one you can find. Oddly enough, this isn't always the wrong thing to do. The cheapest printer we've come across is called the Gemini 10X. We have heaps of them here... they're not really very elegant printers, but they've proven to be reliable and they're actually pretty slick.

The Gemini printers point up a number of the things one should look to in choosing a printer. To begin with, they use teletype ribbons... those little two spool deals that cost anywhere up to a buck and a half and work equally well on printers and 1919 Underwood

Don't Shoot The Printer

typewriters. Now, they don't produce particularly clean looking type, but for printouts, memos, drafts and other such things they're more than satisfactory.

We have other printers. The huge dot matrix machine we use for doing financial spreadsheet printouts and other things that require the use of paper too large to be accommodated by the Geminis uses ribbons made of the same sort of material... but these come as easy to use drop in cartridges. They're convenient, a lot more elegant than the teletype spools... and they cost almost twenty dollars each. There's a lesson in this. If you are going to be using your printer a lot make sure you peruse the cost of the accessories.

Most dot matrix printers use some form of inked cloth ribbon. This is a *multiple strike* ribbon... it can be used over and over. Multiple strike ribbons don't die; they just fade away. However, even when they're new they don't produce exceptionally sharp images.

Most daisy wheel printers use *single strike* ribbons. This sort of thing is a long strip of plastic with ink on one side. Having once been struck, the ribbon will be transparent where the ink has come off it. Single strike ribbons do much nicer work, but they are much more expensive to use.

Printers deal with paper in two ways. The easiest is called *single sheet feeding*... you roll a sheet of paper onto the platten and let the thing print 'til it gets to the bottom, stop, put in another sheet and carry on. It's just like a typewriter.

For larger jobs, however, all this paper manipulation can be a drag. As such, there is tractor feed paper... long fan fold chains of perforated sheets with little holes along the side. This allows the printer to accept a continuous form and make sure that it feeds accurately even after it has spewed through quite a lot of it.

If you are going to do a lot of printing make sure you can get a tractor feed for your printer. Furthermore, make sure it works. Some of the really cheap ones grunch the paper after five or six sheets or whenever anyone burps too close.

Another tricky bit about tractors is that the spacing of the sprockets that tract the paper through the printer is, not surprisingly, quite important. On most printers one or both of these things can be moved so, for example, you can use regular tractor feed paper, narrow sticky labels or perforated continuous form letterhead simply by manhandling the sprockets a bit. Some don't allow for this. A while ago we acquired a really nice Epson printer which everybody fought over until it was discovered that it would only print on continuous form letterhead.

Finally, there is the unpleasant matter of

interfacing the printer to your computer. This is a bit tricky because, as is so often the case, the standards of the interfaces were chosen by fate rather than the intelligent apes that make printers.

The easiest interface to deal with is the Centronics type parallel port. It's easy because virtually all equipment which has this interface is compatible. This is because the standard defines exactly which wires carry which signals and what voltage levels these signals are to be at.

Sadly, the standard omits a specification for the connector to be used.

Some computers and most printers use a large D shaped thing for this task and it has become something of a standard. However, this is not always true and it is very often the case that while all the signals are right, your system was designed by the same guys who did the matching printer. If you decided not to spring for the matching printer you will have to provide the interface yourself.

Virtually all equipment with the Centronics interface is compatible. . .

Making cable to go between two mutually exclusive bits of hardware is a painful task. Your computer dealer may be able to point you towards a company who'll do this sort of thing. Many people will not buy printers which need custom interface cables on ethical grounds, however, as the companies that make the cables invariably have to manacle their technicians to their benches to get the job done.

If you are contemplating the purchase of a printer which will not deal with the standard interface cables available for your computer make sure you can get the cable you need before you lay down your plastic for the printer.

The other sort of interface is the RS-232C serial port. Now, pretty well all of these things use the same physical connector, a small twenty-five pin D shaped device. However, the electrical variables are a killer.

To begin with, data flows over a serial port at a rate agreed upon by your computer and your printer. This is called the baud rate. If your computer sends data at a baud rate that's different from that which your computer is looking for you'll get garbage. Best see if your computer and your printer to be can be set at the same baud rate.

There is also the format of each character, called the *protocol*, to be considered. If these differ, once again, you get *garbanzo*. Some serial ports are designed to drive modems and some are designed to drive printers. While the difference between them is only the location of a few wires, using a printer on a modem port results in... no, actually, that will result in getting nothing at all on your paper.

Some printers want what is called XON-XOFF protocol. Such a machine will gobble characters until it's full, send an XOFF character to your computer to stop it from sending any more data until the printer's thirsty again and then send an XON to start things up again. It's hard monkeys if your computer can't understand these things.

Finally, many printers with RS-232C ports don't actually support the correct voltages to drive a true RS-232 port. Without getting into the grotty details, you may find that the printer is unable to tell your computer that it has received a character and is now ready for the next one. In other words, you'll get one character and then dead silence or a flood of them that confuses the printer, resulting in an interesting array of something that looks vaguely like trying to print a binary file.

Unless you're pretty good at hacking with computers... and sometimes not even then... there is no sure way of looking at a serial printer and *knowing* that it'll work with your system. If you pop for one of these things make sure that you can bring the little monster back to the place you got it if you take it home and it doesn't work.

This is not the same, by the way, as a guarantee that they'll "make it work". A technician without access to your particular computer will be hard pressed to adapt the printer to your system... no matter what the salesman says.

Scroll

There are a whole lot of good printers out there and almost none which are real turkeys. There will be, however, only a few which will suit your requirements. A heavy bit of thinking now will keep you from the dawning realization that you could have avoided all this six months into the future.

Above all else, only buy what you need. There are so many machines available that you should be able to come up with one eminently tailored to your application. Avoid getting bells and whistles you don't want to ring or blow... not only are they expensive, but they're that much more stuff to go wrong.

The great joy in the life of a printer is to go wrong. When you power the beastie and it says "My warrantee has just expired. You're on your own now." you can be sure it isn't going to be a good day.

Software Buccaneers

Argh, Billy ... let's go plunder some software. What's that ye' say? There's a mountie on the bridge ... shiver me timbers.

by "Jolly" Roger Allan

Admit it now ... we've all done it at some point. We've all copied software without receiving Papal absolution (in advance). We've done it for any one of a number of reasons ... we've needed an extra copy as back up, the devil made me do it by appealing to my innate larcenous streak, or why not ... if the companies charge four hundred dollars for a disk that's worth only a few dollars, they must expect it. Figures as to how much software piracy goes on, vary from forty to ninety percent of all software programs sold, depending on who you ask. But the buccaneers among us may find that we may shortly be facing the pointy end of a naval officer's sabre. The powers that be are beginning to flex their muscles.

Where do we stand legally, that is. And more importantly, what can they do to us? I have a distinct aversion to thumb screws. We may not quite be on quicksand but we're also not on the pre-Cambrian shield either.

Legal Bits

There are essentially four points to be concerned with in viewing software piracy. These are the law as it stands, judicial decisions, the law as it appears to be being modified, and the high tech counter attack.

In Canada, the appropriate legislation is known, not surprisingly, as the *Copyright Act*. Enacted in 1921, it came into effect three years later and has subsequently been modified only once ... to protect the then brand new state of the art technologies of player pianos and sound recordings. With typical governmental shortsightedness, our honest legislators failed to mention computers.

Under this act, protection is granted to a "literary work," and the "translations" of such. Further, the act specifies that any attempt to create a "contrivance" to circumvent the protection afforded by the specific articles of the act, will in itself be construed as a breach of the act as per those articles pertaining to the protection afforded "literary works" and their translations" thereto included in the body of the act. (No, I am not attempting to get into Osgoode, it just sounds that way).

In the application of the act to computers, one can very easily get into a labyrinthine maze ... labyrinthine, that is, to a non-lawyer (and not so straightforward to a lawyer either). But being as succinct as one can, the act determines that in "human readable" form, software is a "literary work," and hence subject to protection.

Canada is a signatory to two international agreements governing copyright, these being the Universal Copyright Convention and the Berne Convention. The Berne Convention specifies that copyright automatically arises during the act of creation by the author and does not require notification or a mark of ownership. In other words, if you create it, it's yours; you don't have to tell anyone in any way that you own it. The other convention, the Universal Copyright Convention, does require a marker; the familiar c with a circle around it (©), the name of the copyright owner and

the date of the first publication. Putting the two conventions together, if you are a Canadian and put the little circle thingy somewhere in your program, then your "literary work" ... in "human readable" form ... is protected in about a hundred countries which have signed either or both of the conventions. Further, you can formally obtain a document from the Department of Consumer and Corporate Affairs attesting to your ownership of a copyright. However, this costs and doesn't really beef up the strength of your copyright unless the matter goes to court ... and then only, as an aid to the judge in deciding when the "literary work" was composed. Further, it is not pretty enough for framing.

Putting it all together and applying it to computers, if you are a Canadian and have marked your work with a copyright symbol then the copying ... piracy ... of your program is legal since it is not "human readable," but if the copier uses the program generating a "human readable" form of it, you can nail him or her for breach of the act. Putting the shoe on the other foot, if you make a copy of a commercially available program, say from a floppy disk from a friend, you are in the clear. However, if you use it, producing a print out or some other "human readable" image, say on a video screen, then legally you're at sea in a leaky lifeboat.

However, "for the purposes of private study, research, criticism, review or newspaper summary," Article 17(2)(a) of the act precludes the user from penalty for breach of the act. In other words, if you copy a program, a "literary work", and use it for any one of the above five purposes, your use does not constitute breach of copyright.

This raises the difficulty *vis-a-vis* copying a software program for "private study" or "research." For example, if a person were to copy from a friend a program he or she had purchased which provided a means of, say, analysing the stock market, and used it at home to so analyse the stock market and bought and sold stocks based on the analysis, would the person be in breach of the act? On the one hand, it could be considered a breach, due to the program having generated a "human readable" form of it, but on the other, the "human readable" form was generated for "research" and, arguably, also for "private study." Which way the courts would jump on this one remains unclear.

An analogous situation, though perhaps a more comprehensible one, involves schools and books. Nearly everyone who has gone to university has at some point photocopied something from a book in the

Software Buccaneers

library for use as an adjunct to one of their courses. This is legal: it's "private study." And no doubt everyone has stood waiting patiently while some turkey further up the line photocopies an entire book. What they did was legal . . . again, it's "private study." But if a professor had photocopied a book from the library and then handed out copies of the photocopied book to his or her class, that would not be legal as it was no longer "private study." What then of the professor who photocopies an article and hands out copies of the magazine article to a class? It's legal, because it's student "research."

Firm Ground

Next come the software programs contained in ROMs. How do they fit in? Until recently, the question was unclear . . . now it's just hazy . . . as there had been essentially no significant court cases and lawyers were unsure as to how far this "human readable" business extended within the meaning of the act and whether the current act provided protection or not. The difficulty surrounded the question as to whether "patterns" . . . the shapes of the circuitry, miniaturized and included in the ROM and wired into the computer . . . constituted a "work of art" and hence were copyrightable or not.

Finally, what of making a copy of a program on a floppy and using it as backup? This has never been tested in court and as such there are no precedents. In all probability it's legal, since you would only use it if the first floppy was lost or destroyed in some fashion. Fortunately, a number of companies which sell floppies, particularly those containing business programs, suggest that you make a copy "Just in case." At least so far, it is best for it to be left under the general heading of "what mother doesn't know, mother can't spank your bottom for."

In Canada, there have been a number of cases in which video games have been alleged to infringe on the protection afforded by the act. The legal arguments have revolved around the optical image presented on the video screen by the copyright holder and the alleged infringer. If the images were close enough, the courts have always ruled that the infringer was in violation of the act and damages of some sort have been assessed.

The second pertinent case involved *Spacefile Limited* versus *Smart Computing Systems*. There the question was whether a former employee had copied and taken "confidential" programs and passed them on to the defendant, who subsequently used them for sale. The court ruled that there was "an almost identical copy of the plaintiff's system" in the defendant's system, and as

such Justice Steele applied an injunction against the defendant, prohibiting them from continuing to copy and sell the program until trial. There has as yet been no trial, the plaintiff has secured what they wanted and to leave appeal requested by the defendants was denied last November.

The protection of software by the act was first determined in Canada in 1982 by the Federal Court of Appeal in the case of *Nintendo of America Inc. versus Coinex Video Games Inc.* It was this decision which led the Ontario judge, Justice Hughes, in early December to grant an interlocutory injunction against Computermat Inc. and Computermat's General Manager, Mr. Michael Standford.

The case arose when Apple Computer Incorporated sued Software One Limited, Computermat and Stanford, alleging that the Golden II computer distributed by Computermat breached the act in that the Golden II's motherboard, disk controller card and firmware ROMs duplicated those found in Apple II circuits and Apple's "Autostart" and "Applesoft" routines. Software One did not contest the action and so an injunction was automatically laid against them. No damages were assessed. Exit stage right Software One, at least as far as this play is concerned.

Computermat and Stanford contested the action. Scheduled for an early November hearing, the decision was not handed down until early December. In it, Apple presented five affidavits to demonstrate the relationship between their and the Golden II's system and how the relationship was so close as to constitute infringement of their rights under the act. While the defendants reportedly "hotly contested" the request by Apple for an interlocutory injunction against them, the court upheld Apple's request. In his decision, Justice Hughes referred to the Federal Court of Appeal's decision in determining that breach of copyright had occurred in regard to the software involved, but pointed out that software on a chip and the copyright protection afforded, if any, had never been determined at trial. As such he handed down an interlocutory injunction against the defendants and required that a one hundred thousand dollar bond be posted by them as security, pending the outcome of the trial. In other words, they can continue to distribute the Golden II, but should they lose at trial then, if damages are assessed against them, that the bond may be applied toward the damages.

The net effect of these decisions is that copyright protection of programs on floppy disks has been upheld, while copyright of

software on chips has yet to be determined at trial, but has resulted in the awarding of an interlocutory injunction against the sale of such material by an alleged copyright infringer.

Court And Spark

What does the future hold? There are a number of things. Look for a couple of trials for a start, followed by changes in the act. Then, of course, there will be the counter assault by the high-tech forces employed by the Society for the Suppression of Piracy.

First let's look at the changes in the act. Currently rattling around in the Department of Consumer and Corporate Affairs is a proposal to amend the act in a number of ways to bring it up to date as it were. As far as computers are concerned, there are three possible developments. The first is the requirement that software in ROMs be suitably marked with the copyright symbol as per the Universal Copyright Convention. The minor difficulty with this is that under this Convention a "literary work" only commences to receive protection when it is "published." The question arises as to what constitutes "publication" of computer software. It is customarily agreed that a specific definition to cover the legal meaning of this word will have to be enacted, either as part of the Copyright act revisions or as a separate piece of legislation.

The second contemplated change covers the period of protection. Firstly, copyright protection is for the life of the author plus fifty years. Secondly, it is the opinion of the Department that this length of time is far in excess of any useful period for software protection. Thirdly, the Department believes that the Berne Convention does not cover computer software. Essentially, then, the Department would be attempting to decrease the time period of protection to say, ten or twenty years without contravening the Berne Convention.

Another element to be addressed is the protection under the revised act afforded to programs written *before* the act was revised. Would they be protected for fifty years after the death of the author or, would they only be protected for the ten to twenty years specified under the revised act? The answers are uncertain.

Thirdly, the Department is attempting to address the questions that arise under Article 17(2)(a) detailed above and the problems that it raises *vis-a-vis* "archival" or backup copies.

While it may appear superficially easy to enact these changes, there are ramifications on, among other areas, such as broadcasting in general, video tapes of rock

Exceltronix

Exceltronix
Components & Computing Inc.

May, 1984

Dear Exceltronix Customer,

It is with great pleasure, that due to your annual continued multi-million dollar mail order and walk-in trade support, our company has **quadrupled** the size of our **mail order service**, that we have opened the new **Ottawa location** at 217 Bank St., phone number (613) 230-9000, soon will be opening our new Vancouver location, and will be opening more distribution centres across Canada, as well as our two Bulletin Board Systems at (416) 624-5574, and (416) 293-1796, for information, specials, and for placing orders, and our 1-800-268-3798 for placing orders at any time; all this to serve you better at your convenience.

Along with our amazing growth, come constantly improving distribution and servicing methods, as well as new technological efforts by one of our sister companies, **Multiflex Tech. Inc.**, which gives us one of the broadest selections of computer equipment made in Canada. We strongly believe that we have the highest quality, use the newest technology, and offer you the best possible prices available in Canada. Our company can offer you the lowest prices due to the great buying power of our associated companies. Another of our high-tech sister companies, **Versa-Digital Tech. Inc.**, has designed, developed and manufactured a complex digital time and message display network in the Toronto Transit Subway System. This multi-million dollar project, uses an upgraded and redesigned version of the Multiflex Super System to program the hundreds of digital message centres throughout the subway system. Versa-Digital has become one of the hot spots of technology, as per the Canadian Business Magazine. The numerous high tech projects which have been completed and are being developed at the present time, have thrust us forward as one of the most advanced Canadian computer companies.

Our technical know-how, coupled with our sales and service over the past five years, and our competitive price policy gives you good reason to shop Canadian at Exceltronix Inc. Due to our new mass production facilities, we are able to provide professionally assembled and tested computer products at similar prices to our kit prices. We are able to offer a warranty with our assembled and tested products, which ensures the customer of reliability.

Of course we still have a large selection of TTL, CMOS, linear and microprocessor IC's, memories and EPROMS, as well as all the discrete components and test equipment. Our software and book departments have greater selection than ever before. Prices, of course, are constantly changing; please refer to our monthly specials in ETI, Computing Now!, Computers in Small Business, and Computers in Education, or call for best pricing.

Ordering Information

To order any of our products, please send payment by cheque or money order, VISA, Master Card, American Express, or Diners Club. If you are in a real hurry please use a bank transfer or wire. All non-certified cheques will be held for ten business days for clearance before any items can be shipped. All of the prices include F.S.T.; Ontario residents must include 7% P.S.T. with their order, unless proper exemption forms are supplied with the order. Please note, all prices and specifications are subject to change without notice. Any merchandise to be returned to Exceltronix must have prior written approval, and be accompanied by the assigned RMA number. Please contact our mail order department for more information. Warrantied items will be repaired within a reasonable period of time. Refunds will not be issued in lieu of repairs. A 15% restocking charge will be applied to all items returned for refund unless prior written approval is obtained.

The minimum for all orders is \$10.00. All items will be shipped via UPS or other suitable courier (if possible). Minimum shipping charge, which includes handling and insurance is \$5.00. Shipping rates are dependant on weight and destination, as well as choice of courier company. If you are unsure, please contact our mail order department for your individual requirements.

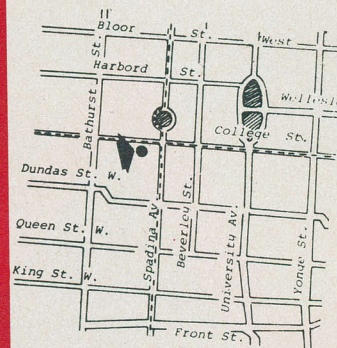

We look forward to your continued support and hope that you will continue to grow with us, in this the most competitive field, computers and components.

Yours very truly,

Eugen F. Hutka

We had to fit it all into 16 pages but we have vastly more than is in this catalogue. For example Resistors, Transistors, Capacitors, SCRs, TRIACS, Crystals and a vast selection of sockets. Prices on the items just mentioned are mostly the same as our November 1983 Catalogue.

Exceltronix

Microcomputers

Apple II + \$995.00

Standard Apple II + includes an attractively packaged system, with upper and lower case keyboard, 48K of RAM, and 8 expansion slots.

Apple II + Package deal for \$1,495.00 includes:

- Apple II +
- Multiflex Disk Drive & Controller
- Multiflex 16K Ram Card
- Multiflex Z80 Card (CP/M software not included)
- Multiflex 80 x 24 video card (with soft switch)

Apple IIe Computer \$1,389.00

Features:

- upgraded version of Apple II
- Standard Packages includes:
- 64K of RAM
 - full upper and lower case keyboard
 - high resolution graphics
 - wide software and hardware support
 - built in self tests
 - compatible to Apple II+, PLUS many more improvements.

Apple IIe Package Deal \$1,950.00

- Apple IIe
- Multiflex Disk Drive & Controller
- 80 Column Card
- Multiflex Z80 Card (CP/M software not included)

Apple Macintosh Computer \$3,195.00

Features:

- ROM. 64K, RAM 128K.
- Microprocessor. The 32 bit Motorola MC68000 microprocessor.
- Disk Drive. Built-in 3 1/2" disk drive, which can store 400 K per disk.
- Mouse. Features: one button, a rotating ball and optical sensors to translate movements of the mouse to Macintosh's screen pointer with pinpoint accuracy.
- Display. Nine inch, high-resolution (512 x 342-pixel) bit mapped display. Green Screen.
- Polyphonic Sound Port
- Optional 3" drives will be available in June from Multiflex Tech. Inc. at unbeatable low prices.

Exceltronix Super 6502 System: EXCEL 2 . . . \$669.00

We strongly believe that our 6502 system will efficiently serve all of your needs; all of the options are on one board. Excel far surpasses many of the other 6502 systems.

Features:

- attractive case
- heavy duty power supply
- superior high quality professional keyboard with upper and lower case, and numeric key pad
- 80 x 24 video, with soft switch on board
- 64K of RAM on board
- 2 Drive Floppy controller on board
- Five additional expansion slots
- Fully assembled and tested, 90 day limited warranty
- (System comes with 2 blank eproms on board; does not include boot software)
- Systems are professionally assembled and tested (boards are wave/flow soldered and ultrasonically cleaned.).

EXCEL 2 Package \$959.00: Includes:

- 6502 system as described above
- Multiflex Apple TM Compatible Disk Drive
- Z80 Board (CP/M software not included)

Apple and Applesoft are trade marks of Apple Computer Canada

EXCEL 6 Package . . \$1,059.00

Features include:

- our super 6502 system (same board, with same features, as used and described in the EXCEL package, BUT:
- comes with new attractive case (as seen in picture)
- IBM compatible extra high quality serial keyboard
- Multiflex serial to parallel programmable ASCII converter card
- Extra heavy duty power supply, with RFI filter and power light indicator built into the power switch.
- Special silent 3" Fan is built in, to keep your system cool.
- one Apple compatible built-in disk drive, which leaves enough space for an optional hard disk drive or another floppy drive.
- (Blank Eproms included, but does not include the Boot software or Basic)

Same EXCEL 6 package as described above, with 2 Apple compatible floppy disk drives. **\$1,289.00**

EXCEL 6, Ultra Loaded Package \$1,889.00

- EXCEL 6 system
- 2 built-in drives (Apple compatible)
- complete Z80 Card (CP/M software not included)
- Multiflex Parallel Printer Card and Cable
- Star Gemini 10X Printer
- Zenith or Amdek 12" green screen or amber monitor, with video cable

With the purchase of any of these systems you are entitled to a 5% Discount on all our Apple software, books 128 k RAM and our Z80/64K Card. Offer valid until June 30th, 1984.

Apple Compatible Peripherals

All of our peripheral boards are professionally built, cleaned and tested, with a 90 Day Limited Warranty.

128K RAM Card

8" Floppy Card

Disk Controller

MULTIFLEX Z80-64K CARD **\$Call**

This spectacular card provides you with the functions of a Z80 card along with giving you extra 64K of self contained memory, on top of the existing memory in your Apple computer. (Software not included)

MULTIFLEX 16K RAM CARD \$59.00

Expand your 48K Apple II+ to 64K. The Multiflex 16K Ram Card allows other languages to be loaded into your Apple from disk or tape.

WIZARD 16K RAM CARD \$89.00

Same functions as Multiflex 16K Ram Card

MULTIFLEX 128K MEMORY CARD .. \$239.00

(with 128K of RAM on board)

(with 64K of RAM on board) \$169.00

(software not included)

128K Card can be used to function as RAM disk with your Apple.

MULTIFLEX UPGRADED Z80 CARD \$59.00

This card allows the user to run Z80/8080 programs on his Apple II+ or IIE computer. Specifically, it allows him to run the CP/M operating system with all its attendant software such as word processors, accounting packages, etc. (CP/M software not included).

MULTIFLEX NEW SUPER 80 X 24 VIDEO CARD **\$85.00**

This new Multiflex card features: • superb 80 columns by 24 lines display, with upper and lower case, reverse video • includes built-in soft switch, allowing you to switch between the Apple's 40 column and the video cards 80 column from the keyboard. • superb compatibility.

MULTIFLEX PARALLEL PRINTER INTERFACE CARD WITH CABLE **\$69.00**

This card plugs into any of the Apple II+, IIE, or work-alike computers, and provides the user with a parallel interface capable of handling graphics and characters. Ideal for use with the Star Gemini and Epson Printers.

WIZARD IPI INTERFACE **\$85.00**

MICROTEK APPLE DUMPING PARALLEL CARD \$169.00

Similar functions as Multiflex Parallel Printer Interface Card with Cable.

WIZARD BUFFERED PARALLEL INTERFACE CARD

BPO 16 \$189.00
BPO 32 \$239.00

MULTIFLEX SUPER SERIAL CARD \$99.00

This card allows you to: • select desired baud rate • connect to a serial RS-232C modem, terminal, or a serial printer port • for example, connect two Apple computers (using this card) to communicate with each other, through the RS-232C link over hundreds of feet.

MICROTEK SERIAL CARD FOR THE APPLE **\$139.00**

Similar functions to MULTIFLEX super serial card.

MULTIFLEX FLOPPY CONTROLLER \$69.00

Features:

- plugs right into slot #6 in your Apple computer
- capable of handling up to two Apple compatible drives.

RANA FLOPPY .. \$149.00 CONTROLLER CARDS

Features:

- plugs right into the Apple computer
- handles up to four Apple compatible drives

MULTIFLEX FLOPPY CONTROLLER FOR 8" DRIVES \$Call

This card plugs into the Apple computer and allow you to use 8" DS DD Disk Drives. (Software not included).

MULTIFLEX EPROM PROGRAMMER \$69.00

Features:

- Eprom programmer for Apple computers • Programs 2716, 2732, 2732A, 2764 • ZIF socket for the EPROM
- Complete with software • Comes with a built-in programming voltage supply.

Included with the card is a disk full of software, which using menus allows the user to program or verify EPROMS, check if they are blank, set pointers anywhere in memory, and save or load memory ranges to/from the disk drive, making this unit a very versatile piece of hardware for the hardware developer or hobbyist.

APPLE COMPATIBLE DISK DRIVES FAMOUS MULTIFLEX DISK DRIVE \$248.00

Features:

- Apple compatible • Attractively packaged • Professionally built and tested • Canadian Made • 1 year warranty • We believe that Multiflex put out more drives in the last year than all other Canadian manufacturers combined.

PACKAGE DEAL #1 Includes:

MULTIFLEX DISK DRIVE (as described) and MULTIFLEX FLOPPY DISK CONTROLLER \$309.00

PACKAGE DEAL #2 Includes:

TWO MULTIFLEX DISK DRIVES AND MULTIFLEX FLOPPY DISK CONTROLLER \$555.00

Also available: If you have more money to spend:

Quentin Drives.....	\$299.00
Microsci A82 80 Track.....	\$539.00
Microsi A2.....	\$310.00
RANA Elite I.....	\$342.00
RANA Elite III.....	\$989.00
RANA Controller.....	\$149.00
(90 Day Warranty)	

Exceltronix

Multiflex Products

Multiflex Economy Video Display Terminal

Now available from MULTIFLEX is an economy video display terminal. Originally designed as a low cost access unit for our mail-ordering and bulletin board system, this terminal is a semi-intelligent system which is controlled by a Z80A microprocessor and a 6845 CRT controller chip. The keyboard is fully ASCII encoded and the character generator contains the full 128-character set as well as a 128-character alternate set both of which are in the 5x7 dot matrix format. The screen display is 80 characters by 24 lines if the unit is hooked to an external monitor. (Monitor not included). There are 3 software selectable attributes (dim, reverse video, and alternate character set) which can be chosen one at a time for the whole screen. The attribute can then be switched on and off for each individual character. A 2K buffer is provided for normal operation. However when the optional 6K memory upgrade is purchased, 4 screen pages can be loaded from the host machine, edited, locally, and then downloaded back to the host again saving on connect time and phone line bills. Also included are 2 RS232 ports: one for a modem and one so that a printer can be attached to the terminal. The baud rates on these ports are software programmable and can range from 110 to 9600 baud. With all these features, you would expect to pay a lot for this system, but all this is available to you, complete with an attractive case, for an extremely low price.

Terminal Complete: Tested and 90 days warranty with 2 RS232 ports, 2K buffer case and power supply (Hydro approved)

\$319.00

6809 Board

Multiflex Terminal

U of T 6809 Single Board Computer

The 6809 Single Board Computer, designed at the University of Toronto and distributed exclusively by EXCELTRONIX, is a compact hardware unit which was designed originally as a lab board for teaching students about microprocessor systems. Its many features, however, make it an ideal unit for stand-alone control applications or software development systems as well.

The system is designed around the Motorola MC6809 microprocessor. This is an 8-bit processor with full 16-bit internal architecture, 2 index registers, 2 stack pointers, 28-bit or 1 16-bit accumulators, a direct page register and a wide range of addressing modes, including a program-counter-relative mode. This mode allows the user to write completely position independent software, important in systems software development.

There is provision for up to 48K bytes of dynamic RAM on-board. The refreshing of this RAM is controlled by an 8202 Dynamic RAM Controller. This chip allows for completely transparent refreshing of the RAM (ie. no wait states to slow the system down). There is also provision for up to 12K of EPROM using 2532 chips.

There are 4 complete I/O circuits built onto the board. 2 of them are serial (RS232); one is used for a terminal (which is required for use of the board with the supplied monitor software), and the other one is user defineable, but it is set up to

communicate with either a modem or a printer. Also on-board are 2 6522 VIA chips. These provide 2 parallel ports per chip along with 2 16-bit timer/counters. One of the parallel ports and one of the timers are used by the monitor software to provide a cassette interface (which operates at 300 baud). The second parallel port on that chip is wired into a connector which is ideal for interfacing a parallel printer or keyboard. The 2nd VIA is not used at all and is completely free for the user. For further expansion of the system, a fully buffered version of the CPU signals (data, address, control lines and a signal indicating whether or not the current address is located on the board) is available at a cable connector.

The software provided with the system is in a 2532 EPROM and allows the user to: test the memory; dump blocks of memory; examine and modify single memory locations; read or write from the cassette port; set and examine breakpoints; single step and/or execute machine language programs and set and examine the processor registers. All this is accomplished through a 9600-baud terminal interface (one of the serial ports). Included is a full screen editor/assembler which allows the user to work in 6809 assembly language rather than machine language. All this makes this board an ideal trainer, control unit or software development unit for just about anyone.

Includes U of T course documentation

**A&T with 48K
\$389**

Special Pricing is available when both items on this page are purchased together

Multiflex Z80A "System

Do you need a good, fast and reliable S-100 Z80A CP/M system? One you can afford?.. Here it is.. \$1,499.00, (Offer valid till June 1, 1984)

The Loaded "SMART" Package

Features:

- Z80A CPU with 64K Memory
- one RS-232 Serial Port (second RS-232 port optional)
- parallel printer port
- 6 slot S-100 Back Plane
- Floppy controller board capable of handling up to four DS DD, 5 1/4" or four 8" disk drives.
- video board 80 x 24 with buffer memory and keyboard interface
- IBM compatible professional (serial output) keyboard
- two SA 455 disk drives
- powerful power supply, with silent fan and power to spare for more 5 1/4" drives, if needed.

\$1,499

Optional:

256K memory board. See back page (16) for description and price.

- CP/M 2.2.....\$159.00
- 12" Green or Amber Monitor.....\$139.00 (with cable, ready to plug into our video board)
- Gemini 10X Printer and cable, ready to plug in.....\$379.00

- TTX Letter Quality Printer and Cable.....\$629.00

For under \$2,000.00, you can have all the computer equipment you have always wanted, but couldn't afford. Special variations of this package are available, please call.

Hobbyists Delight

Multiflex Single Board Computer starts at \$399

For \$399.00 you obtain the following minimum essentials, which allow you to start using the board.

- Z80A CPU section with 64K RAM
- Floppy Controller section
- Minimum requirements for the on-board video section, 1 parallel port

If you have the basic board, all you need extra are:

- Keyboard, starting from.....\$49.00 to \$200.00
- Monitor, start from.....\$59.00 to \$200.00
- Power Supply.....\$139.00
- CP/M.....\$159.00

Optional Features. Call for pricing

- Full IEEE S-100 bus for easy expansion.
- Up to 256K of on-board dynamic RAM.
- Processor speed 4 MHz.
- Memory management for up to 16M bytes of memory.
- 3 16 bit timer/counters.
- 2 RS232C serial ports.
- 24 line parallel port.
- Real time (time-of-day) clock.
- Floppy disk controller.
- 80x24 video display.
- 512x512 bit-map graphics
- Print spooler.
- Optional RF modulator.
- Priority interrupts.
- Fully CP/M compatible.
- Many jumper-selectable hardware options.

The MULTIFLEX Single Board Computer is among the new breed of state-of-the-art Canadian computer products. With a Z80 series microprocessor, 64K of dynamic RAM, a full featured floppy disk controller and a 80x24 video section, all on the board, this unit makes an ideal low-cost system for the CP/M operating system.

The memory section has a number of unique features rarely to be found on any other machine. The circuitry is provided on-board for up to 256K of dynamic RAM (using 4164 64K x 1 chips). Jumper options allow

the user to select one of three options with regard to wait states (no wait states, wait states on operation code fetches, or wait states on all memory accesses) so that the user can configure his system to his requirements. Four jumper-configurable sockets are furnished as well. Any mix of 6116/2016 (2K x 8 RAM); 2716 (2K x 8 EPROM); 2732 (4K x 8 EPROM) or 2764 (8K x 8 EPROM) can be placed in this socket, which can be enabled to shadow any other memory which would be addressed in these locations. It is also possible to disable these sockets in software, if the user wishes to do so. Full memory management is available on the board which can turn the Z80's standard 64K address space into the full 16 Mbyte 24-bit address space allowed by the S-100 bus standard. This memory management applies to the 256K RAM on-board, all other on-board, all other on-board memory, and all memory on the S-100 bus.

The board also contains a full-featured floppy disk controller. Based on the WD1793 IC, this section will handle any combination of 8" or 5 1/4" drives, whether they be single or double sided. The newest technology was also used in designing the data separator circuit. This circuit is all-digital, allowing extremely reliable use in the double density mode. The floppy controller is fully compatible with both CP/M, giving the user full flexibility as to what operating system he wants to run.

For interfacing to the real world, the user is again given the flexibility to configure the system to his own needs. Supplied are 3 independent software and/or hardware controlled 16-bit timer counters, 2 of which are used to generate the baud rates for the 2 on-board RS232C serial ports. Both of these ports are programmable for either synchronous or asynchronous operation. A full 24-line software controlled parallel port and a real time (time-of-day) clock, which can be backed up with batteries if the user so wishes.

The real-time clock, the floppy controller, the timers, and any other I/O port can be chosen to operate

in a software selectable priority interrupt scheme. A second interrupt controller allows the on-board interrupts to be vectored with and other interrupts from external S-100 bus boards in a jumper selectable priority.

There is a full video section on the MULTIFLEX Single Board Computer as well. A second Z80 processor is used along with a 6845 CRT controller, giving the user a variety of features. Up to 8K of EPROM can be used to control the section, allowing emulation of a variety of terminals or room for custom display routines. 8K of static RAM is also provided for, this being used for the display buffer, the Z80's work area, and a print buffer. The print buffer can be used for the built-in Centronics-type printer port in the section. An ASCII keyboard port is also provided. The character generator on the board provides up to 256 characters and symbols, which are user-programmable since they are in a 2732 EPROM. The video output is available in two forms: a composite video signal, and the separate sync and video signals, allowing the board to be used with a variety of monitors. As well, circuitry for an optional RF modulator is provided on-board, for easy connection to a TV set. The actual display format in text is 80 characters by 24 lines. But, a 192 by 256 pixel graphics mode is also made available to the user. The resolution of this graphics mode can be changed by the user by providing additional software. A full, general, graphics interface (for joysticks, digitizing tablets, touch panels, etc.) and a light pen input are provided so that user-friendly software is easy to implement on the system.

Overall, the MULTIFLEX Single Board Computer, with its numerous features can be many things to many users, from a full-featured Z80 development system to a very powerful CP/M based computer.

Exceltronix

The "BEST"

IBM Compatible Microcomputer

See the Review
In March 1984
Computing Now!

\$1995

Not a kit — a complete system

This price includes:

- 64K of RAM with pre-socketed provision for 256K
- One disk drive. 5A455. Double Sided. Double Density
- Colour Video Board
- Floppy controller capable of handling up to four DS. DD 5 1/4" disk drives and socketed for optional serial port and real time clock
- Monitor not included

Warranty:
Full 120 day
Warranty

IBM is a registered trade mark of IBM Canada Ltd.

Prices do NOT include IBM (Microsoft) BASIC or any proprietary software.

OR The Loaded "BEST"

Everything in our \$1995 System plus:

- Two DS. DD 5 1/4" Disk Drives
- On-board 256K of RAM
- RS232 Port

\$2595

OR 10 Meg Hard Disk Version

Everything in our \$1995 system plus:

- 10 Meg Hard Disk Drive & Controller
- On-board 256K of RAM
- RS232 Port

\$3995

The BEST is an IBM compatible Microcomputer Standard features include the following: 8088 processor running at 4.77 MHz for fast service. (Room for the optional new co-processors, the most popular being the 8087 "number crunching" processor)

- 64K RAM expandable up to 256K in blocks of 64K and with the new high density RAMs, there is enough room onboard to hold 1 Megabyte of data in blocks of 256K.
- 5 expansion slots each being identical, so the user can upgrade his machine with IBM compatible hardware.
- D.M.A. controller. Three of the DMA channels are available to the user.
- A timer/counter. This is used by the system for time of day clock; tone generation of the speaker; and a time base.
- An 8 level interrupt controller, 6 of which are bussed to the expansion slots for feature cards. The other two are used for the time of day clock, and the keyboard circuits. (There is also a NMI which is not user accessible since it is used for parity checks.
- Three ROM sockets are available to the user, one generally holds the system BIOS, and the other two can hold any firmware the user wishes to implement.
- A speaker with 1/2 W of driving power is available to user software which can also control the frequency of oscillation. In fact 3 methods exist to modulate the speakers output: 1) direct control or the output bit stream. 2) output from the programmable timer. 3) the timer clock can be modulated with a program controlled I/O register bit.
- A keyboard interface which is compatible with all IBM compatible keyboards through a 5 pin DIN connector.

OPTIONAL FEATURES FOR THE BEST

Because the standard BEST system comes with a 5 1/4" floppy DS, DD, disk drive it was felt that need for the cassette interface would dwindle, thus, to keep costs down the cassette has been designated as an option.

The cassette option requires that the user supply his own good quality cassette recorder and the system board communicates through either the microphone or auxiliary input. The data rate is between 1000 and 2000 bits per second depending on the bit stream sent to the recorder.

IBM Compatible Boards

Floppy Disk Controller

Parallel Card

Hard Disk Controller

Colour Video Card

8088 Board (call for pricing)

COLOUR GRAPHICS VIDEO BOARD \$339.00

This board was designed to be compatible with a wide variety of display systems. Two types of output connectors are provided: 1) composite baseband video 2) direct RGB drive (9 pin D-shell Connector). In addition a light pen port is provided. It must be stressed that this card can be used in black and white with comparable resolution to that of the black and white board. Thus a low cost black and white monitor could be used in place of the more expensive colour monitor without loss of performance (of course colour cannot be achieved on a black and white monitor).

There are 4 modes of supported operation (more are available but the user must write his own software): low resolution graphics, high resolution graphics, low resolution alphanumerics, and high resolution alphanumerics. In the low resolution modes colour is available in a variety of foreground/ background/overscan colours. In high res. there is only black and white available, this is due to the video memory limitation.

GRAPHICS

LOW RESOLUTION:

In low res. graphics the screen is memory mapped into 320 PELS by 200 rows. Each PEL may have one of four colours. The background colour may be one of 16 possible colours the other three may be one of two selectable palettes, namely green/red/brown or cyan/magenta/white.

HIGH RESOLUTION:

In this mode all of the memory is mapped to the screen, thus only black and white is available. In high res. there are 640 PELS by 200 rows, twice that of low res.

ALPHANUMERICS

In both low and high res. alphanumeric mode the characters are generated via an eeprom, thus special characters are easily implemented. In addition, it is possible for the user to specify the location of his own eeprom external to the video board and be able to utilize both eeproms for character generation.

LOW RESOLUTION:

Low res. is characterized by 40 columns by 25 rows of characters. Each character is composed of an 8x8 dot matrix. The characters are enclosed in a 7x7 matrix within this box, with 1 line for descenders. Sixteen foreground colours are supported and 8 background colours are available. In addition, blinking of individual characters is also available.

HIGH RESOLUTION:

High res. supports the standard 80x25 character matrix for high bandwidth monitors. Because all of the memory is used to display characters, colour is not available, however high res. supports the following on a per character basis: reverse video, blinking and highlighting.

IBM COMPATIBLE EXPANSION CARD

This card is really meant for IBM users who want IBM compatible products at sensible prices. (Note that the options presented here are already included in our BEST Computer.

This combination of options allows an IBM user to save I/O expansion bus room by providing a multitude of popular options on one board. (For a complete description of the options see other BEST products).

BASIC EXPANSION CARD \$199.00

Includes 64K of RAM and completely socketed for the other options.

OPTIONS:

RAM. For each extra 64K RAM (to maximum of 256K total) \$85.00

PARALLEL & GAME PORT \$69.00

Will also drive parallel printer.

SERIAL PORT \$69.00

REAL TIME CLOCK \$59.00

CARD with all the above (256K RAM) \$599.00

Printer cables and software not included.

FLOPPY CONTROLLER BOARD AND OPTIONS

This board actually contains three separate units, one being standard and the other two being options. The standard unit is the floppy controller card. The options being the asynchronous serial interface and the other being a real time clock with battery backup.

FLOPPY DISK CONTROLLER: \$299.

This controller can control four 5 1/4" floppy disks. Two disks are controlled by an internal daisy-chained ribbon cable, the other two are connected externally through the back panel via a connector. The controller is based on the NEC Upd 765 or Intel 8272 chip and can control double density/double sided floppy disks, thus giving a formatted capacity of about 320K bytes per drive. The card uses the main boards interrupt and DMA capabilities to improve performance. The board also features write precompensation and digital phase lock loops for "solid" reliability.

ASYNCHRONOUS COMMUNICATIONS

OPTION \$69

Communication is achieved through one of two means: standard RS232 protocol or through a 20mA current loop.

The transmission speed is programmable from 50 to 9600 baud, with 5,6,7, or 8 bits per character and 1, 1 1/2, or 2 stop bits, any combination is supported. The system is based on the INS8250 chip which also provides the following features in addition to those above:

- full double buffering, eliminating expensive, precise synchronization.
- full modem control functions: CTS, RTS, DSR, DTR, and RI.
- false start bit detection.
- line break generation and detection.

This card interfaces easily to any one of the popular modems as well as being able to fully exploit the capabilities of the 'smart' modems.

REAL TIME CLOCK: \$59

This option is based on the MM58167 CMOS chip, thus battery backup is easily implemented, this allows continuous time keeping even when the machine is powered down.

FLOPPY BOARD including both options above \$399

No cables or special software included.

continued on next page

This prices shown are introductory and are subject to change.

IBM Compatible Boards

PARALLEL/GAMES PORT

This low cost board allows any IBM compatible printer to be connected to the system. The printer signals are through a DB25 connector and can be connected to many parallel Ideal Printers — Gemini, Epson, TTX printers. This card is not only for printers, but can be used where parallel data must be transmitted from the system. It has 12 TTL output lines which can be written and read under program control. Usually 8 are used for data and the others are used for handshaking with the external device. There is also an interrupt line, which the external hardware can 'tickle' for prompt immediate service. (Such applications as real time data acquisition).

The game port allows 4 paddles or two joysticks to be connected to the system. In fact any variable resistive element could be connected and the software would still give a value proportional to the resistance. This allows industrial applications to be realized easily with existing hardware.

\$149.00

HARD DISK DRIVE AND CONTROLLER

The disk drive is a two platter random access device that fits into the same space as a 5¼" floppy disk drive. Each surface has one moveable head to service 306 cylinders with a total capacity of 10Mbytes (17 sectors/track, 512 bytes/sector, with 1224 tracks).

The hard disk controller shown in the picture can handle two such disks allowing a total of 20Mbytes of mass storage.

HARD DISK & CONTROLLER \$1,669

IBM is a registered trade mark of IBM Canada Limited.

EPROM PROGRAMMER

This card can program any one of the following eproms: 2716, 2732, 2732a, 2764, and the new 27128s. Two sockets are available on the adaptor board, one for the 28 pin eproms the other for the 24 pins eproms. These sockets are standard sockets, however as an option ZIF sockets will be inserted. (We recommend ZIF sockets if large number of eproms will be programmed). Also as an option an extension board is available, this board attaches to the adaptor via a ribbon cable and extends out the back panel. This is to allow eproms to be programmed without removing the cabinet cover every time programming is to be performed. Also as a standard feature, the source software is supplied to allow users to modify the programme to suit their needs.

As an option a serial port can be included on the card; this serial port has the same features as the port described with the floppy disk controller (see the floppy disk description for documentation of the serial port).

MAIN EPROM PROGRAMMER CARD (WITH SOFTWARE)

With 2 standard EPROM sockets **\$149.00**

EPROM PROGRAMMER WITH ZIF SOCKETS (WITH SOFTWARE)

With one 24-pin SIF socket and one 28-pin ZIF socket with provision for serial port. **\$189.00**

EXTERNAL CARD

Ready to plug into the main EPROM Card (includes one 24-pin and one 28-pin ZIF socket and cable). Saves you from opening the computer each time you want to program your EPROMS. **\$69.00**

SERIAL OPTION

For your main EPROM programmer. Provides you with a second RS232 serial port. **\$49**

Exceltronix

HOBBYIST DELIGHTS AT UNBEATABLE PRICES!

The Best IBM Compatible Case...\$89.00

This attractive case made out of metal and aluminum, with a superb paint job looks like the real thing. It is made so that 8088 peripheral boards can be mounted securely to the case, rather than hanging loose in the motherboard. This case is ideal for use with the 8088 board or 6502 boards. Customers have remarked that they have not seen any other case which looked as well designed as this one. We highly recommend it.

Notice the mounts for your 8088 peripherals and the pre-punched mounting and ventilation holes, along with the two disk drive supports.

Superb 6502 ABS Case and Keyboard \$190.00

Ideal for 6502 boards, including a reliable heavy duty keyboard with upper and lower case characters, and numeric keypad.

Also available, a very attractive but low cost aluminum case.....\$19.95
Aluminum case with keyboard.....\$69.00

IBM Compatible Keyboards...\$189.00

We had looked at about 8 companies keyboards, including several from Taiwan, before we came to the conclusion, that these keyboards were not only super reliable and had a nice feel to them, but were also most economical. This is why we selected and ordered thousands of Cherry and Maxiswitch keyboards.

This professional IBM TM compatible keyboard with serial output, is ready to plug into an IBM or a compatible computer. Available now, high quality keyboards made for professional use by Cherry and Maxiswitch. They are both remarkably good, but it's your choice. Both are priced at \$189.00.

MULTIFLEX SERIAL KEYBOARD ENCODER \$69.00

- changes the serial code into parallel ASCII output with programmable characters.

- Ideal for your Apple, or any 6502 system with ASCII input.

You will love it and to the best of our knowledge, only we carry such a deluxe feature board.

WE also offer other brand new ASCII keyboards for as low as UNBEATABLE!

MUSIC BOARDS FOR YOUR APPLE.....call for price MAKE YOUR APPLE 8088 compatible call for pricing

Even though we sell bare boards for many of our products, we recommend to you to buy our finished products and in most cases, we challenge you that it will cost you as much to buy all the parts and build it, as it will cost you to buy a professionally built, wave/flow soldered, and ultrasonically cleaned boards, which have been professionally tested, and are guaranteed, and allow you to learn and enjoy your computer, rather than running around town chasing that odd value capacitor or these days many hard-to-get chips. On top of all these frustrations, you try to debug your board, in many cases having to pay to get your board(s) up and running. But if you are still not convinced here we offer you the widest selection, at the best prices (for prime parts anywhere) with a wide selection of parts for your 6502 and 8088 board and the peripheral boards. (Before you buy, calculate!)

Ready Built or Kit?

Come to Exceltronix before you buy anywhere else. We've been here for nearly 5 years.

74S374	Octal D latch	3.99

We apologize for the high pricing. This is due to the severe parts shortages and our costs have in most cases doubled. Unfortunately this shortage is expected to last until 1985.

We do however have an enormous inventory of hundreds of thousands of parts and we can supply industry at bulk rate pricing.

Despite the rise in prices, we are sure you will find our pricing most competitive and our stock position excellent.

For current pricing, consult our monthly specials.

Prices subject to change without notices.

Contact us for OEM pricing.

POWER SUPPLIES

This is the deal of the Century

KEPCO POWER SUPPLIES

Rated at 90W!

RFI filter and fuse on board

Open Fame \$ 69.00

Cased with powerful, 3" silent fan . . . \$139.00

Quantity discounts available. Dealer enquiries invited.

Hydro approved, Cased version is designed so that the fan draws the air from inside of the system, through the power supply box and out. Beautifully quiet, switching power supply.

After evaluating a dozen power supply manufacturers, we found a supply, which truly exceded our expectations. This KEPCO power supply is a high quality switching power supply, which meets industrial needs and will superceed hobbyists requirement. We highly recommend it. This supply is made in JAPAN, not TAIWAN. This power supply module would normally cost approximately \$100.00 wholesale price, in thousand lots. Due to the fact that we purchased over 5 thousand of these units, which we also use in production, we would like to pass along the savings... Take advantage of this opportunity.

Ratings: Dual

12 Volts, 12 V at 2.8A
12 V at 2 A -12V at .5A

+ 5 V at 5.0A We tested the + 5V, it works beautifully beyond 6 A. We also tested these power supplies at much heavier loads and they worked perfectly. You can get considerably better performances from these supplies, when they are fan cooled. Documentation and schematics are provided with each KEPCO power supply.

Ideal for 8088 and other IBM compatible system. Will handle up to 4x5 1/4" disk drives with power to spare.

Boschert Power Supply \$199.00

Sorenson Power Supply \$250.00

Multiflex Z80A

S100 Starter System

Complete, assembled and tested

\$299

This price good
until June 1st, 1984.

Regular \$450

Options:

64K Dynamic RAM & Multi-
plexers \$88.00

Big Piggyback Board with
RS232 and Real Time Clock
. \$179.00

RS232 Option for Mother-
board \$38.00

DC to DC Converter Option
. \$29.00

Extra S-100 Connectors
(each) \$5.95

MULTIFLEX's Z80 computer is a versatile and expandable stand-alone computer system designed and built right here in Canada. It uses the newest technology to provide the user with the most capabilities for the smallest price-tag. Its adaptability to any situation and extremely low cost allow it to be used in many applications ranging from a trainer to a complete CP/M-based computer comparable to the best on the market, at a fraction of the price.

The actual layout of the system is a two board design. One board (the "motherboard") contains a 24-line parallel I/O chip for interfacing to the external world, an RS232C serial port with baud rates selectable from 110 to 9600 baud, a hex address and data display, a hex keypad, 14 monitor function keys, 2 user definable keys, a 40-chip wire wrap area with full access to all the bus signals, on-board provision for regulators so that the board can be supplied with standard S-100 voltages, an EPROM programmer which will handle 2708 (1Kx8), 2716 (2Kx8), 2732 (4Kx8) 2532 (4Kx8), 2764 (8Kx8) and the brand new 27128 (16Kx8) EPROMs, a DC-to-DC converter to supply the programming voltage to the EPROM programmer and four (4) slots for IEEE S-100 compatible boards for further expansion. This is an extremely useful and important feature as it allows expansion of the system with all boards using this industry-standard bus structure, which are available from MULTIFLEX, as well as from hundreds of manufacturers worldwide.

The other board is the CPU card. This card plugs in-

to one of the S-100 slots on the motherboard and is IEEE 696/S-100 compatible with the full 24-bit address path to allow up to 16 megabytes of memory to be addressed. The processor used is the Z80 (running up to 6 MHz) and there is provision on-board for 64K of dynamic memory (using 4164 chips) which will operate without wait states. Provided for as well is a 2K to 32K (selectable in 2K blocks) common resident area in memory for use with multiple memory banks. There are also 4 sockets on board which will handle 2732 (4Kx8) or 2764 (8Kx8) EPROMs or the new 6116/2016 (2Kx8) static RAMs (all of which can be software deselected if desired) to allow the user complete versatility in setting up the board to meet his own specifications. Also on board is 1 parallel port with 24 lines of I/O and 3 16-bit counter/timers for applications which require the unit to keep track of real time. Another feature of the CPU board is that it was designed by our engineers to run the CP/M 2.2 disk operating system so that if a floppy disk controller board is added to the system a fully configured CP/M machine can be set up for a very low cost as described on page 13.

The monitor software that comes with the kit is a well-written extensive package which allows the user to have complete versatility in machine language programming and execution as well as control of all the features on the board. The monitor functions include: examine/modify memory locations, memory block moves, compare 2 blocks of memory, examine CPU register, ex-

amine I/O ports, load and save from cassette calculate relative branch offsets, set breakpoints single step programs, execute programs, and program EPROMs. Each of these process is invoked by a single keypress. Also available to the user are 2 spare keys definable for special functions a required by specific applications and applicator programs.

Available as an option, there is a piggyback board which attaches to the CPU board and give the user a real-time/time-of-day clock with battery back-up, memory management for up-to 16M of memory in 4K blocks, 2 RS232C ports which have independent software selectable baud rates, vectored interrupts for the on-board I/O and clock devices, and a general interrupt controller designed to handle multiple interrupts for up to 7 other boards.

All these features make this a very impressive stand-alone unit and, when combined with the S-100 boards either from the MULTIFLEX line or from most other manufacturers, give the user the potential for a very powerful microcomputer system.

The standard kit includes the CPU board with a Z80A (4MHz) processor, 2K of RAM (a 6116), and 4K of EPROM (a 2732) as well as the motherboard with all the features mentioned above except the RS232C port and the DC-toDC converter. Also supplied are sockets for all IC's and 1 S-100 connector.

Multiflex S-100 Video Board

This board is an intelligent, I/O mapped, 80 x 24 Video Display Board. Based on the 8275 programmable CRT controller, the 8257 programmable DMA controller, and a Z80 processor. Provided on board is 8K of static RAM which gives the user 3 1/2 screens of text. With simple commands, the user can easily scroll around in this buffer, clear the present page and home, home on the present page and go to the beginning of the buffer. There are also 4 field attributes (blink, reverse video, underline, and highlight) which can be turned on and off by software. Other software commands include a carriage return, line feed, clear to end of line; transmit cursor location; transmit character at cursor location; position cursor; disable control functions; reset control register; as well as all the standard functions such as tab return, line feed, and backspace. Also included in the software is a debug/setup program which completely tests the board and allows the user to set up various parameters on it. The output from the board is in either composite video or a video signal with separate horizontal and vertical sync signals (either normal or inverted).

\$269.00

Multiflex S-100 Floppy Disk Controller

The MULTIFLEX floppy disk controller is a state-of-the-art IEEE 696/S-100 compatible board. It allows the user to interface, simultaneously, up to four (4) 8 inch or 5 1/4 inch disk drives in any combination to his system with the flexibility of single/double sided and single/double density operation. If desired, all operations with the optional on-board controller or under processor control. Latest technology has been used in this design. The board is designed around the FD2793 controller chip for easy use under any operating system. However, this board is especially designed for easy use with the CP/M or MP/M operating system (available as an option) and the MULTIFLEX Z80 computer kit. With all these features and its reasonable cost, this board is one of the best buys in a floppy disk controller board on the market today.

\$269.00

\$100.00

MULTIFLEX 256k RAM CARD

- Provides user with upto 256k of Dynamic RAM.
- Uses 4164 150ns.
- Refresh of RAM can be handled externally (if Z80 processor is available or internally if no refresh signal is available).
- Waitstates can be jumper selected.
- Compatible with CP/M and MP/M operating systems.
- Bank select feature.
- Write protect option.

**Complete RAM CARD
With 64k of RAM — \$249**

128k — \$319 256k — \$439

MULTIFLEX S100 64K STATIC RAM CARD

- Uses 2K x 8 static RAM chips.
- Static RAM eliminates problems with refresh.
- Optional provision for battery back up provides you with ideal way to store data even when the power is turned off.

Complete board with

4k RAM — \$99 32k RAM — \$250
16k RAM — \$170 64k RAM — \$399

COST ISN'T OUR ONLY ADVANTAGE

Our complete line of 100% Apple® compatible disk drives are not only superior in performance and reliability; they offer you a choice.

Whether you select our full height AP-100, our slim line AP-105 or our new ergonomically designed twin pack AP-110, you can rely on Quentin to deliver quiet, fast and efficient performance.

When you are ready to step up to Winchester mass storage, Quentin will be there to meet your growing needs, from 5 to 31 megabytes of formatted capacity with the Q-500 and Q-600 series.

Every Quentin drive has been engineered to provide you with years of reliable service and we stand behind that promise with a one year limited warranty on parts and labor. Your Authorized Quentin dealer will be happy to demonstrate all of the outstanding features of our range of disk storage products, including the cost; but remember "cost isn't our only advantage."

shows, digitized sound recordings, laser operated optical music discs and interactive optical teaching programs. The intricacies of such considerations are beyond the per-view of this article. Further, there is some thought that particularly useful software programs, such as *Wordstar*, *VisiCalc*, some educational programs and some authoring languages . . . proprietary ones, that is . . . may have useful lifespans in excess of the ten to twenty years that is currently being considered by the Department. In any event, before the legislation goes to a second reading, it will be referred to Committee where members of the public and industry will have an opportunity to express their opinions.

However, no matter what the Copyright Act says or what the penalties handed down by the courts become, there will always be software pirates. Currently, it costs some five hundred to seven hundred and fifty million dollars in lost revenue to software producers each year. Needless to say, such producers are determined to develop some way that their programs can be protected from illicit copying. As yet, there is no sure way of stopping it. There are all sorts of ideas and systems, and many of them are marketed, but none are totally successful. Anyone who is "into" computers can find a way around them, or if not, there are a number of bypass systems that can do the job all but automatically for the chronically lazy.

Essentially, software protection systems can either be built into the hardware . . . very expensive and not totally secure as yet . . . or placed on the software itself . . . cheap but providing little or no protection.

When computers were dropping from the mainframe to the mini size, the emphasis was on improving and cheapening hardware protection systems. With the advent of micros on a mass scale, concurrent with a veritable torrent of floppy disks to feed them, the emphasis switched to software protection systems with little or no success. The emphasis currently is to switch back to a hardware based protection system for the micros.

There are any number of these on the market, none of them totally secure. All can be cracked or bypassed. But the forces employed by the software manufacturers have sharpened their pencils and lubricated their intellects and "progress" seems to be being made.

One of the more interesting developments is a product put out by the Vault Corporation of Westlake Village, California, and called *Prolock*. Analogous to a lock and key, the system involves a proprietary process in which "fingerprints" are physically imposed as visible dots on the backside of the floppy disks. This "key" must be present before the protected software is able to run. In practice, a software buyer obtains blank disks containing the *Prolock* fingerprints and eight to twenty K of associated software. Then as he or she copies the program onto each unique disk, the *Prolock* software encrypts the program's source code several times, linking the encrypted program to the physical fingerprint.

Before the program can be run it must find its associated hardware key within the computer. It is all user transparent. This system therefore permits the user to make back-up copies of the program on other

floppies or hard disks. Pirated copies will not run on another computer without the appropriate decoding contained on a single floppy held by the company. While this system is really only of use for companies who may be held liable for the illicit copying of programs by their employees, it does present a cheap step forward. Further, by copying purchased software onto the *Prolock* disks before placing it in general use by staff the companies can protect sensitive data or expensive systems. Some eight million disks are expected to be sold this year, approximately one percent of all floppies sold in the United States. While not foolproof to the expert in computers, it is felt that ninety percent of all copying is casual . . . and this appears to be a way of slowing it down, if not in fact completely stopping, the casual software piracy of business programs.

The High Seas

The long term advantage to having a protected system, in the industry view, is that the price of a floppy containing a software program would drop dramatically. Currently, such companies charge an enormous premium knowing that their programs are unprotected and will be copied no matter how many warning signs are stuck on the floppy's label cautioning the purchaser not to. If these companies could be reasonably certain that their programs would not be copied, they would charge a more realistic price . . . between 15 and 35 percent of what they currently charge.

As matters currently stand in Canada, thou may copy, but thou may not use the copy.

PRINTOUT

Canada's Microcomputing Newsletter

Suite 601
25 Overlea Boulevard
Toronto, Ontario
M4H 1B1
(416) 423-3262

How much do you value accurate, objective, timely information about what is happening in microcomputing in Canada? Certainly highly, but where do you get such advice? We have the answer.

That is why we are launching PRINTOUT, Canada's Microcomputing Newsletter, the finest publication of its type. It has one aim and one aim only - to keep you informed and abreast of current developments, new products, people, companies looking for retail outlets, outlets looking for products, and more.

PRINTOUT is a true newsletter - it carries NO ADVERTISING or paid information. It is concise, informed and published by the company that knows what is happening in the Canadian Microcomputing Field - Moorshead Publications, publishers of Computing Now!, Electronics Today, and Computers in Education. PRINTOUT as a newsletter, however, will not be a consumer magazine since it will contain the urgent information you need to obtain or maintain market share. You need it quickly, and that's how you will receive it.

It is not inexpensive, good information never is, but neither is it expensive at \$8.48 per issue. It appears 23 times a year, sent by FIRST CLASS POST in the middle and at the end of each month. That makes PRINTOUT \$195 a year, but isn't it worth it to know what is going on? Each issue will contain contacts and information that is going to make you a lot of money. That's what it's all about.

As an introduction to PRINTOUT, however, if we receive payment before May 31st, there is a \$50 discount: you pay \$145 for a full year or \$95 for six months.

We are so sure that PRINTOUT is good value that we will refund your complete subscription if you cancel before your third issue is mailed, thereafter we will refund the unexpired portion if you don't think we are doing the job. That demonstrates the confidence we have.

We wouldn't ask you to subscribe without some idea of what to expect so a sample issue is enclosed. Don't miss out. Send off your cheque today. The first regular issue will be mailed on about April 30th.

Sincerely,

Halvor Moorshead

Fruit Crate

If there has been a small insane voice inside your skull trying to talk you into setting up a BBS here's your chance to shut it up. The Fruit Crate is the simplest, least expensive way to get on line yet.

by Steve Rimmer

Modems are a sort of place of mind... once you get your head around what it means to use one your cosmic space will be forever changed. Having one isn't as good as studying Zen for twenty years, to be sure, but you can't buy good Zen

over the counter any more. Besides, there's all that sitting around and thinking involved in it.

Modems are considerably easier to implement. You can simply plug one into your computer, boot the terminal and talk to the universe. Plug in a fancier terminal and you'll be able to do things like download software and capture text. However, the real spiritual grandure of modern ownership is not in any kind of terminal at all. In fact, it doesn't even involve you directly.

The absolute slice is in setting up and running a bulletin board.

A BBS is a very sophisticated bit of software. It can be as complex or as simple as you feel like having it, deal with whatever part of creation you think needs addressing and can have a personality all its own. The rewarding

thing about doing a board is that you get to communicate... or telecommunicate... with a lot of other souls in your space.

The unfortunate thing about BBS software is that half of all that there is in the world is very expensive... and doesn't work well... and the other half, while free, is hard to find... and doesn't work well either. This has dissuaded many computer users from setting up their own systems.

With all of this flowing through the nexi of our 6502s, we set about to assemble the Fruit Crate. Presented here, the Crate is a BBS package for anyone who wants to get on line with minimum of digital sweat. It runs on the common Apple clone, lowly entity that it is,

TEO™ Daisywheel Printer

At 18 characters per second the TEO Daisywheel Printer is one of the fastest and most affordable letter quality printers on today's market. Additionally it has been designed to use readily available standard "QUME" print wheels and ribbons. This is a high quality, superbly crafted, dependable printer for word processing, personal or business applications. Its compactness, durability, and professional looking printing make it ideal for the office, as well as home use. Interface cards are available for most common computers including Commodore VIC 20 and 64, Atari and Apple Computers.

TEO™ Dot Matrix Printer

This exceptional printer is compatible with Epson's MX-80FT, Commodore's 4023 and Mannesmann Tally's Spirit 80 dot matrix printers. Capable of full graphics printing, it operates bidirectionally at 80 characters per second and features a unique square dot for dense letter-like character formation, and has both a friction and tractor paper feed. Interface cards are available for most common computers including Commodore VIC 20 and 64, Atari and Apple Computers.

If only Charlie had a choice.

At first glance, this machine may bear a certain resemblance to its mentor. That's before you turn it on.

COLUMBIA

DATA PRODUCTS, INC.

Appearances can be deceptive, as a look at the credentials of the Columbia MPC machine will tell you.

Way out front in value and performance.

Operating system software is MS-DOS or CP/M 86. Its 16 BIT 8088 hardware configuration provides 128 K Ram with parity, two RS-232 serial ports, Centronics parallel printer port, DMA controller, eight levels of interrupt, dual floppy disc system with one megabyte storage, Winchester interface and eight expansion slots. In addition you get Asynchronous Communications Support, Diagnostics and the Columbia Tutor program. This means your Columbia MPC is up and running right out of the box. Space Commanders and Fast Graphs show off the Columbia MPC's full-colour graphics. Not bad for the standard version.

Greater software compatibility.

Today, the Columbia MPC takes on hundreds of IBM®-PC compatible software programs and IBM-PC add-ons or peripherals. The Columbia MPC works with a world of software. \$3,000 worth comes free with the system. Included is the entire self-teaching Perfect Software™ family: Perfect Writer™, a word processor; Perfect Speller™, a 50,000 word dictionary; Perfect Filer™, a data base manager; and Perfect Calc™, a financial calculation system.

And you know the other great thing about the Columbia MPC?

It's there now. Available off the shelf. And PPI has a nationwide dealer network waiting to start deliveries.

See the complete line of Columbia products at a dealer near you.

Charlie didn't have a choice. You do. The Columbia MPC

with either a Hayes Micromodem II or an SSM card. It requires no other hardware and no freaky software save for what's already in your computer. For the most part, it runs in Applesoft.

Drive That Thing

If you understand what a BBS has to do, figuring out what this package is up to will be a lot easier. In essence, a board must listen for a caller and, when one comes by, answer the phone and run a program. The program is the thing that logs you on, eyes your password and handles the messages. However, while it's about this it must also be vigilant about checking for carrier. If the caller hangs up unexpectedly it must be able to reset itself and make things ready for a new caller.

Now, none of these things are conceptually very difficult. What does get a bit tricky is the possibility of having the caller snuff it at virtually any point in the running of the board. In other words, things could cease to be while the system is printing a message, updating a file or waiting for input. Obviously, for example, if you do an INPUT and the party on the line takes off, your board is going to be sitting looking for somebody to talk to it for a long time.

There are a number of ways around this. The one which we've taken here... arguably the best, and certainly the easiest, is to modify the operating system of the computer slightly to install what is called a *host*. In the simplest

sense, this is a collection of hooks which will make the remote caller's keyboard act like it's your own.

If you think about this it's fairly easy. When you tell your fruit to GET A\$ what it actually does is look at the keyboard port location... \$C000... and wait for some life. This is, in fact, a loop. It will keep looping until the value in this location gets above \$80, indicating that a key has been hit.

This loop can be modified. You could have it look at the keyboard and, if there's nothing waiting for it there go up and check out the modem status location. If there's nothing there it's back to the keyboard, and then to the modem... until, breathless, it comes up with a legal code.

If we include a carrier status check in this loop the system becomes unhangable. So long as there's a caller the computer will loop and wait for input. If the caller hangs up and the carrier goes into the Twilight Zone the system can break out of the loop and take appropriate action.

The little machine language routine shown here... the HOOK... goes into DOS and installs the routines to make the board look for carrier and do the parallel I/O we've been speaking of. All you have to do is to BLOAD it and CALL 768... where it lives. It will get it's act together, install itself in DOS and... if you make it active when there's no one on line... restart your system.

Up On Line

Getting the Fruit Crate together involves rather a lot of typing, but very little else. To begin with, you'll have to enter the code in programs one and two.

The Crate consists of the large Applesoft program that does most of the work and the small host driver called HOOK.OBJ0.

One important thing about this system is that it likes to reset itself if it's in any way disturbed. As such, having entered it SAVE it real quick... before you run it. SAVE the main board program as whatever you've initialized your disk to see as the startup file... probably HELLO.

Next, run program two. This will generate the HOOK binary file that will be inhaled by your program.

Finally, install your Micromodem or SSM card in your Apple and reboot things. The board is designed to have the modem in slot one rather than two, as some users will have other serial devices living in two. You can change this if you want to by adding sixteen to the slot dependent addresses in the program for each slot you want to move up by. This would also entail changing the source code for the HOOK and re-assembling it.

The Works

The Fruit Crate, despite its length, is a very simple BBS. It provides all of the plain vanilla board functions... however, written in Applesoft it's extremely easy to alter when you want it to do more.

The log on procedure gets the caller's name and password. If the caller is new it adds this stuff to the USERS file. If the caller has been on the system before it makes sure that the name and password match or it gets annoyed and repeats the log on procedure.

The message function involves a fairly unusual file structure. If you enter a message into the system it will be stored in high resolution page two and then BSAVE'd. The statistics about the message... who it's from and going to, how long it is and so on... are placed in the SUMMARY file, a random record structure.

Getting a message back entails BLOADing it. This has the advantage of being extremely fast. It litters up the disk with a lot of files, but this is really not much of a problem as they're all small. DOS uses relatively little file space overhead.

One other unusual feature of the system is in the host driver... It'll let you see the control characters on your local screen. They don't show up on the caller's tube. Thus, ends of lines are terminated by "M", backspace is "H", and so on. This is quite useful, as it allows you to see what your callers are trying to do.

Log Off

The Fruit Crate is a good way to meddle with telecommunications... without buying a lot of expensive software or getting bytes stuck under your fingernails trying to hack bizarre code. It's easy to get on line and easier still to modify as you develop your system.

Naturally, a bulletin board will change your head a little. It will turn you into a SYSOP... complete with long dripping fangs and a predilection for getting hairy when the moon is full. You'll have to adjudicate in the life and death struggles of messages. Your existence will be given over to the service of humanity... no, make that your phone line will be given over to the service of humanity.

It's a really interesting application for your computer... if you can keep your fingers from getting violent when some fool wants to CHAT at four thirty in the morning.

The source code for the hook has been left out because of space considerations and because most people don't want to look at these things. It's not a secret, though. Send us a self stamped and addressed envelope and it's yours.

CNI

Moorshead Publications

Computing Now! Book Shelf

A selection of books from the most complete magazine book service in Canada. A catalogue of all of our titles is available free on request.

BEGINNERS

BP115: THE PRE-COMPUTER BOOK \$8.10
Aimed at the absolute beginner with no knowledge of computing, this entirely non-technical discussion of computer bits and pieces and programming is written mainly for those who do not possess a microcomputer but either intend to one day own one or simply wish to know something about them.

HB131: THE BEGINNER'S GUIDE TO BUYING A PERSONAL COMPUTER \$6.45
Written for the potentially interested computer buyer, in non-technical language, this affordable book explains the terminology of personal computers, the problems and variables to be discussed and discovered while making that initial buying decision. The book does not make recommendations, but does present a great deal of information about the range of hardware available from the largest personal computing manufacturers. Readers discover the meaning and impact of screen displays, tape cassette storage and disk storage, graphics and resolution, and much more. Comparison charts clearly define standard and optional features of all the current mass market personal computers.

HB114: COMPUTERS IN ACTION: HOW COMPUTERS WORK, 2nd ed. \$13.20
SPENCER
The book answers the questions: "What are computers?" "How do computers work?" and "What can a computer do?" Features microcomputers and microprocessors; floppy disks; input/output units such as COM; and a section on structured programming, the APL language, and the RPG language.

HB115: THE FIRST BOOK OF MICROCOMPUTERS: THE HOME COMPUTER OWNER'S BEST FRIEND \$11.00
MOODY
"... excels in the quality of its cartoons, illustrations, diagrams, and layout." *LIBRARY JOURNAL*. Explains what personal computers are and what you can do with them. Learn how to speak the language of computing and how a personal computer works.

The last chapters detail the many home and business applications of your personal computer, including such things as home protection, keeping track of budgets and bills, game playing, tax calculation, and inventory management.

AHG1: HOW TO BUY A PERSONAL COMPUTER \$4.45
SHRUM
A practical, uncomplicated guide to microcomputer hardware and software. Includes an up-to-date chart comparing most of the popular systems.

A CONSUMER'S GUIDE TO PERSONAL COMPUTING AND MICROCOMPUTERS, SECOND EDITION
FREIBERGER AND CHEW

HB1 \$16.45
The first edition was chosen by *Library Journal* as one of the 100 outstanding sci-tech books of 1978. Now, there's an updated second edition!

Besides offering an introduction to the principles of microcomputers that assumes no previous knowledge on the reader's part, this second edition updates prices, the latest developments in microcomputer technology, and a review of over 100 microcomputer products from over 60 manufacturers.

THE ESSENTIAL COMPUTER DICTIONARY AND SPELLER \$10.45
AB011
A must for anyone just starting out in the field of computing, be they a businessman, hobbyist or budding computerist. The book presents and defines over 15,000 computer terms and acronyms and makes for great browsing.

BEGINNER'S GUIDE TO COMPUTER PROGRAMMING \$16.45
TAB No.574
Computer programming is an increasingly attractive field to the individual, however many people seem to overlook it as a career. The material in this book has been developed in a logical sequence, from the basic steps to machine language.

AHG13: THE COMPUTER COMPANION: A DICTIONARY/REFERENCE GUIDE \$4.45
LEDIN
Filled with hundreds of clear explanations of technical terms and acronyms, plus useful computer facts.

SB21860: YOUR OWN COMPUTER (2nd EDITION) \$13.45
Explains what it would be like to own a computer — what you could do with it, how it could make your life easier, and how you might look into buying one for your own uses. Explores applications, buzzwords, programs, hardware, and peripherals, among other things. Compares 30 different personal and small-business computers now on the market. Easy to read, informative, and ideal for newcomers to computing.

SB22008: WHAT DO YOU DO AFTER YOU PLUG IT IN? \$16.00
W. BARDEN, JR.
Complete tutorial covering use of microcomputer hardware, software, languages, operating systems, data communications, and more, followed by another tutorial on workable solutions to the practical problems you'll meet while using them. Also has good advice on choosing a system and the software to run it. Valuable new material for beginners and veterans alike.

MICRO-PROCESSORS

Z80 USERS MANUAL \$21.45
AB010
The Z80 MPU can be found in many machines and is generally acknowledged to be one of the most powerful 8 bit chips around. This book provides an excellent 'right hand' for anyone involved in the application of this popular processor.

Tab1491: 101 PROJECTS FOR THE Z80 \$30.45
Gives you hands-on experience in interfacing fundamentals plus a thorough grounding in creative programming. There are hardware and software applications and several that combine both.

PH248: MICROPROCESSORS \$20.45
Covers microprocessor theory, operation, computer arithmetic, programming, and interfacing.

A BEGINNER'S GUIDE TO COMPUTERS AND MICROPROCESSORS — WITH PROJECTS. \$14.45
TAB No.1015
Here's a plain English introduction to the world of microcomputers — it's capabilities, parts and functions ... and how you can use one. Numerous projects demonstrate operating principles and lead to the construction of an actual working computer capable of performing many useful functions.

BP66: BEGINNERS GUIDE TO MICROPROCESSORS AND COMPUTING \$7.55
E.F. SCOTT, M.Sc., C.Eng.
As indicated by the title, this book is intended as an introduction to the basic theory and concepts of binary arithmetic, microprocessor operation and machine language programming.

There are occasions in the text where some background information might be helpful and a Glossary is included at the end of the book.

SB21877: MICROPROCESSOR CIRCUITS, VOLUME 1: FUNDAMENTALS AND MICROCONTROLLERS \$14.45
Intended for service technicians, computer technicians, industrial control personnel, students, hams, and others who need to learn microprocessor basics. Brings you a chance to learn microprocessor theory and gain valuable practical experience at the same time! Excellent for home study and in-plant training. Features actual demonstration circuits easily built with solderless boards and readily available chips and parts.

PH154: SYSTEMS MADE SIMPLE ON THE IBM PC
R. FLANDERS & D. FLANDERS \$26.50
 Now the techniques used to design major computer systems have been reduced to terms that average personal computer users can apply. Through Structured Analysis and Structured Programming approaches, the user is taken step-by-step through the design and implementation of the systems.

PH155: HOW TO WRITE AN IBM-PC PROGRAM
E. FAULK & DATAMOST \$20.45
 Assuming only a minimal knowledge of the computer, coverage includes everything from where to get programming ideas to fixing the bus the easy way. Illustrated.

PH156: BUSINESS APPLICATIONS FOR THE IBM PC
S. ZIMMERMAN & L. CONRAD \$24.45
 Designed for the first-time business user of the IBM PC. Offers step-by-step instructions on the use and customization of existing business software programs. Provides actual programs that are essential to many business functions.

PH157: INTRODUCTION TO CICS PROGRAMMING
L. MILLER & L. VIANOS \$33.50
 Presents a step-by-step, easy-to-follow introduction to the practical use of CICS — an IBM software product for data communications and the development of on-line computer applications. All examples shown are independent of the operating system, but they assume a basic knowledge of COBOL.

PH158: IBM FILES
D. MILLER \$20.45
 Shows how to access your IBM-PC's full potential. Takes the mystery and misery out of creating your own files. Written for both the beginning and advanced programmer.

PH160: USING THE IBM PERSONAL COMPUTER
T. LEWIS \$20.45
 A guide to general use of the IBM Personal Computer, covering BASIC commands, how to use word processing software, the use of VISICALC and creating new programs.

PH161: IBM BASIC FOR BUSINESS & HOME
R. FUNKHOUSER \$20.45
 Without the ponderous detail of the manufacturer's manual, this book shows the new micro user how to write programs for the IBM PC. No prior knowledge of computers or electronics is necessary to understand and use the information.

PH162: THE VISICALC BOOK FOR THE IBM PERSONAL COMPUTER
D. BEIL \$21.45
 This book is designed to help the user to get more out of VISICALC (an extremely useful "electronic spreadsheet" software program) on the IBM Personal Computer.

APPLE

ARCP3: 101 APPLE COMPUTER PROGRAMMING TIPS & TRICKS
F. WHITE \$13.00
 Practical ready-to-type-and-run software. 96 pages.

HB105: BASIC APPLE™ BASIC
COAN \$19.25
 A complete guide to Applesoft BASIC. Takes you from beginning concepts, such as entering data and obtaining output and planning programs, to more advanced topics, such as numeric and string arrays and sequential and random-access files. Alternate techniques for programming in Apple Integer BASIC are also covered. Discusses Lo-Res and Hi-Res graphics.

HB107: GRAPHICS COOKBOOK FOR THE APPLE
WADSWORTH \$14.95
 Learn how to use your Apple II to "paint" shapes, objects, and letters in low-resolution graphics. The author provides a library of microcomputer graphics including such multicolored illustrations as robots and flying saucers, trees, sailboats, and colourful picture backgrounds. Contains complete annotated Applesoft BASIC programs to draw all the pictures described in the book as well as suggestions for improving programming techniques.

HB110: APPLE PASCAL: A PROGRAMMING GUIDE
TUCKER \$27.45
 This class-tested text offers a complete, self-contained introduction to programming using the Apple UCSD Pascal language. Tucker's accessible coverage introduces Pascal via a subset language (Eight Statement Pascal) to orient and involve students from the start. He teaches Apple editor and file commands early and provides extensive examples, exercises, and lab problems keyed to a variety of fields from business to science. Structured programming is used throughout.

PHS2: APPLE GRAPHICS GAMES
PAUL COLLETTA \$33.50
 Contains 10 arcade-style games written especially for the Apple II, including Spider, Piano, Pairs and Poker, as well as education, math, and designing games. Book/Disk Package.

SB21959: THE APPLE® II CIRCUIT DESCRIPTION \$33.00
 Provides you with a detailed circuit description of the Apple II motherboard, including the keyboard and power supply. Comes complete with timing diagrams for major signals and discussion of differences between the various revisions. Good for technicians, serious hobbyists, and others with some knowledge of digital hardware.

SB21889: INTERMEDIATE LEVEL APPLE® II HANDBOOK
D. HEISERMAN \$24.45
 Hands-on aid for exploring the entire internal firmware of your Apple II and finding out what you can accomplish with its 6502 microprocessor through machine- and assembly-language programming. Good introduction if you're ready to move out of BASIC but don't want to buy more hardware.

PHS1: PASCAL FOR THE APPLE
IAIN MACCALLUM \$34.20
 A step-by-step introduction to Pascal for Apple II and Apple II Plus users. The package of text and software diskette provides readers with worthwhile and interesting programs which can be run immediately and the results studied. Includes over 200 exercises with full solutions. Book/Disk Package.

PHS17: MULTIPLOY (APPLE II)
P. COLETTA \$30.45
 "Arithmetic can be fun?"
 "YES!" Simply slip MULTIPLOY into an Apple II and you're under attack; math problems come down the screen and unless you answer them correctly — WHAM! — you're a goner. Four math operations — three levels of play. Software Package.

PHS18: WORDWORX (APPLE II) \$60.50
 WordWorx consists of two fantastic word games — "Myspellery" and "Sentence Builder." Each game can be played competitively or solo, and at a variety of difficulty levels. They're both challenging learning tools for kids and brain-teasing fun for adults. Software Package.

Tab1513: APPLE II BASIC \$23.45
 Does far more than teach you BASIC vocabulary. Includes a library of subroutines that form the cornerstone of this unique programming approach. Other topics include formatting hard copy, PEEKs, POKEs, CALLs and other output techniques, sequential text files; random access files; sorting routines; number crunching, etc.

SB21846: ENHANCING YOUR APPLE® II — VOLUME 1
D. LANCASTER \$23.00
 Who but Mother Nature or Don Lancaster could successfully enhance an Apple? YOU can, with help from Volume 1 in Don's newest series for Sams. Among other things, you'll learn (1) to mix text, LORES, and HIREs together anywhere on the screen in any combination, (2) how to make a one-wire modification that will open up whole new worlds of 3-D graphics and other special effects, plus (3) a fast and easy way to tear apart and understand somebody else's machine-language program. Other goodies abound!

BASIC

SB21836: ADVANCED 6052 INTERFACING \$19.00
 Numerous examples of the 6502 and 6800 families, plus fundamental concepts help teach you design of interface circuits, understanding of LSI devices, and solutions to typical problems of ground noise, isolation, and transient and lightning damage. Contains many techniques valuable in the field of machine control.

BRAIN TICKLERS
AB005 \$9.00
 If the usual games such as Bug Stomp and Invaders From the Time Warp are starting to pale, then this is the book for you. The authors have put together dozens of stimulating puzzles to show you just how challenging computing can be.

BASIC COMPUTER PROGRAMS IN SCIENCE AND ENGINEERING
GILDER \$18.00
HB08
 Save time and money with this collection of 114 ready-to-run BASIC programs for the hobbyist and engineer. There are programs to do such statistical operations as means, standard deviation averages, curve-fitting, and interpolation. There are programs that design antennas, filters, attenuators, matching networks, plotting, and histogram programs.

GAME PLAYING WITH BASIC
SPENCER \$17.45
HB10
 The writing is nontechnical, allowing almost anyone to understand computerized game playing. The book includes the rules of each game, how each game works, illustrative flowcharts, diagrams, and the output produced by each program. The last chapter contains 26 games for reader solution.

PH179: BASIC PROGRAMS FOR HOME FINANCIAL MANAGEMENT
W. GOLDSMITH, Jr. \$17.45
 This book is a 33 program home financial management system written in BASIC. It includes descriptions, listings, and sample runs and programs that are adaptable to TRS-80, Apple II, and other home computers.

SB22047: 26 BASIC PROGRAMS FOR YOUR MICRO \$17.45
 Features 26 previously unpublished, simple-to-complex games you can run on almost any brand of microcomputer as long as you have enough RAM on board. Most take between 500 and 5000 bytes, with the highest taking 13K. Conversion charts that let you key them into your Radio Shack, TRS-80, Apple II, Times/Sinclair 1000 (ZX81), Spectrum, Atari, or PET are included. Also features notes on program techniques and structures.

Tab1380: 30 COMPUTER PROGRAMS FOR THE HOMEOWNER IN BASIC \$16.45
 Programs include a telephone timer, decor redesign, cheque-book program, a "coupon" organiser, menu planner and calorie planner.

Tab1533: GRAPHICS PROGRAM IN MICROSOFT BASIC \$19.75
 Generate computer art including mathematically defined art and animated graphics; draw still pictures — realistic and abstract; create an interactive space shuttle simulation; plot architectural and landscape drawings with both high and low resolution graphics; construct a 3-dimensional model of a function; plot 2-dimensional graphics, statistical relations, maps and diagrams. All these are written in Microsoft BASIC that is adaptable to just about any BASIC micro system.

SB21941: BASIC: FUNDAMENTAL CONCEPTS \$33.00
 Introduces the BASIC language and compares its two major dialects by Microsoft and Digital Equipment Corporation. Teaches you the elements you need to convert programs from one BASIC dialect to another and helps you understand what happens when your computer tries to run a program in a dialect it can't understand. Third in Sam's computing series.

SB21841: BASIC PROGRAMMER'S NOTEBOOK \$21.45
E. SAVAGE
 A valuable book that provides you with many timesaving BASIC sub-routines and programming practices usually known only to highly experienced programmers. Also contains several debugged and easily modified program samples you can use.

SB21942: BASIC: ADVANCED CONCEPTS \$33.00
 Last in Sams' special four-volume series on computers and computing. Uses BASIC as a tool to help you study program storage within the computer, explore the limitations of floating-point arithmetic, and examine number systems commonly used in computing. Complements and adds to the fundamental commands and concepts of No. 21941, the preceding volume.

THE MOST POPULAR SUBROUTINES IN BASIC
TAB No. 1050 \$10.45
 An understandable guide to BASIC subroutines which enables the reader to avoid tedium, economise on computer time and makes programs run faster. It is a practical rather than a theoretical manual.

PROGRAMMING IN BASIC FOR PERSONAL COMPUTERS
AB015 \$13.45
 This book emphasizes the sort of analytical thinking that lets you use a specific tool — the BASIC language — to transform your own ideas into workable programs. The text is designed to help you to intelligently analyse and design a wide diversity of useful and interesting programs.

COMPUTER PROGRAMS IN BASIC
AB001 \$15.45
 A catalogue of over 1,600 fully indexed BASIC computer programs with applications in Business, Math, Games and more. This book lists available software, what it does, where to get it, and how to adapt it to your machine.

List! Special

Every now and then, inspiration hits. After you dress the resulting wound, you sit down at your computer to write, revise and debug until your fingers bleed. The result of all this bloodshed, however, is a program that you can call your own.

The main purpose of our normal monthly List feature is to give readers a bit of typing exercise to complement a free program. Unfortunately, space constraints usually mean that only one or two listings get in each issue. This means that there's little variety, and we stockpile a large number of programs.

This is the CN! List Special, a selection of short programs written by owners of varied computers. Most of the listings can be fairly easily converted for other computers, so don't be put off if you don't see your machine listed on the next few pages. Few violent POKES or PEEKS have been implemented.

Computing Now! pays authors for their original short listings. If interested in the resulting fame and fortune, send your programs to List, in care of this magazine.

Hasten to your keyboard, gentle reader. The listings await.

Craps

by Chris Buffett

A game of chance for the TRS-80 Color 2 computer. Be warned ... this program enjoys winning.

SSM Modem Review

Smart modems often seem destined to outthink their owners. Sometimes this is a function of stubbornness. The SSM smart modem card is compatible with Apple compatible systems, Hayes Micromodem II based software... and most users.

by Steve Rimmer

Modems are an area which even the stoutest of heart will confess a certain fear. They're among the most difficult computer peripherals to work with because their problems are so hard to debug. It's not at all unexpected that the most useful modems are the most difficult to deal with when one is developing software for them.

Conversely, when the beady eyed little port crawlers really do get going, sophisticated "intelligent" modems are a great trip to use. They'll do everything but shine your eyes for you and can make the glorious ordeal of telecommunications really high tech and spiffy.

Remember dialing, waiting for the carrier and then jamming the phone receiver into those cracked rubber cups? Remember the interesting kaleidoscopic effects your screen did whenever the cat walked into the room and burped? Well, you don't have to think about those things any more.

The more well known of the *ubermodems* is probably the Hayes Smartmodem. While it has been around for a bit, it's still one of the most useful systems. More recently, there has appeared something called the Micromodem II, a plug in modem card for the Apple II+... and clones thereof... which operates in something like the same way as does the Smartmodem.

The Micromodem is a really decent bit of hardware... so much so that a number of

systems have been developed which emulate it. Now, these are not clones in the normal sense of the word, inasmuch as they don't look or work much like the Micromodem. However, they are largely compatible with software designed to drive the Hayes.

One of the most often come upon Hayes compatible Apple modem cards is the SSM modem from Transend. Built in California, the SSM is a little cheaper than the Micromodem and rather more compact, as the Hayes card requires the use of a large external power supply. It will run on any fruit clone and on the Apple IIe.

Purple Hayes

The SSM modem plugs into any slot on the motherboard except for the leperous slot zero which you aren't ever supposed to touch. It's generally popped into slot two, which is recognized as the serial port slot by the majority of software.

The SSM is a complete modem, rather than just a serial port card, so it plugs directly

into the phone lines. There's a small RJ11 jack gorch'd onto the board for the task and a cable is supplied for the system.

Like many of these newer cards, the SSM modem has an EPROM in amongst its circuitry with quite a bit of intelligence in it. Initialize the card by laying IN#2 and PR#2 on the system and the thing will start looking for someone calling its name.

The SSM modem thinks that its name is control A. Hit a control A and the card will say SSM MODEMCARD: HELLO. A right idiot, actually, this little fellow. If someone called *me* a control A I'd... well, I suppose that some of us must be born modems.

In amongst the firmware smarts of the modem is a simple terminal package. They get you into using that first, as it illustrates a lot of what the card can do. Control A Control F will make it into a terminal. Control A control Q allows you to dial a number. Wait... what's this...

Yes, the dumb terminal actually lets you type in a number and it'll dial the thing for you. You have a choice of touch, tone or pulses. In fact, this isn't quite as slick as it sounds because it dials as you type... in other words, you can't backspace if you hit a wrong digit. However, dumbness must have its costs.

Once you've had the thing dial something for you it will wait for a carrier... informing you about what's going on... and, should you actually reach whatever party it is that you're after... the SSM will terminal

The SSM modem card comes complete with a phone cable, on board firmware and a manual. There's also this trendy box.

YOUR COMMAND BRIDGE, PREH COMMANDER ELECTRONIC,

The keyboards
with a special
touch

- programmable intelligent keyboard for high throughput data - entry applications
- the keyboard's electronics are built around a single-chip microcomputer
- software changes are made with the erasable programmable read-only memory on the mc-chip
- more than 200 internal characteristics of the encoder (8 diodes) can be defined

SSM Modem Review

for you and let you babble away to your heart's content. It makes a fairly decent terminal as these things go... but a fairly decent terminal can be done in less than fifty bytes of code, so you'd expect this.

At least none of the prompts have spelling errors. It's very depressing when you come across one of these in a four hundred dollar card.

The system does a number of things besides just being a dumb terminal, however. For example, with some additional software it can be a smart terminal. There are a number of commercial super terminal emulators and support things for the Apple which will drive the SSM modem. Most will want to be set up for the particular card they'll be looking at. This actually isn't a problem with the SSM... most of the time... because it emulates a Hayes Micromodem II. Most terminal packages can deal with a Micromodem.

However, be warned. There are a few differences between the Hayes and the SSM and occasionally these will confuse software designed for one and used with the other. It's a bit like shooting squirrels with a bent gun, I know.

Remote Control

There are a number of other, more sophisticated functions of the SSM card which you'll probably begin to appreciate after you've toodled with the thing for a while. To begin with, it can do what is called *auto answer*. This means that it will sit and vegetate until the phone rings and then electrically answer it, optionally blasting out an answering carrier. This is the stuff of bulletin boards, of course, but it has other functions.

The SSM card can perform a host function for your fruit as well. This means that someone can be sitting at another system clear across town and call yours. The modem will answer the phone, establish contact with the other machine and thereafter the caller will be able to operate your machine as if he were sitting in front of it... except that everything will happen at three hundred baud, of course. In fact, the SSM card also supports one hundred and ten baud for those rare instances when one wants such a facility, but, being slower still, this represents no immediate solution.

If you can't quite comprehend programming at three hundred baud, try entering `SPEED=125` into your fruit and listing a program.

Still, this capacity can be extremely useful for transferring programs, simple telecommunications and even having someone else help you with your programming problems.

Yes, you can actually call Max across town and have him work on your funky code with you. This host facility seems to work under virtually anything that runs with DOS... with the exception of programs that use the graphics modes.

The remote caller has a fair bit of control over your system. By using control codes someone far off can do things like change the setting of a linefeed toggle, go into terminal mode for a chat and even hang up the phone. The control N function, which sets the thing to producing line feeds after carriage returns for the remote caller acted a bit funny for the modem we were using inasmuch as it cleared the screen on the local tube and thereafter did all its I/O through the modem exclusively.

The manual didn't mention this aspect of things but, then, as it turns out, there is a fair bit of stuff it doesn't speak of.

Hardware In The Sky

Using the SSM modem at the hardware level is technically no more complex than would be using the Hayes. They are very similar, in fact, both being based around the 6850 ACIA chip. This is actually one of the better choices for use on the Apple... it's a great deal more suited to the 6502 environment than some of 8080 style serial chips that are often pressed into service.

Ahem, however, the real salamander in the mechanism is not on the card itself, but, rather, in the manual. In fact, the book which comes with the SSM is fine for a bit of simple terminalling and so forth. There are a few example programs which will explain how to use the thing for uncomplicated BASIC functions. However, the hardware

documentation is the essence of brevity. It has a few quick shots at the register locations and then moves on to greener pastures.

Now, in fact, the information's all there. However, you need a copy of the 6850 data sheet and a fairly decent background in hardware engineering to dig it out.

What makes this all the more uncool is that the card is actually perfectly easy to figure out if you have access to the manual for a real Hayes Micromodem, which is done up rather better. This latter is replete with example programs and all sorts of descriptions of the memory locations involved in using the system and what goes on therein.

It's still a bit baffling, but at least it's available.

Furthermore, the latter half of the manual for the SSM card is taken up with a reprint of the P.A.M.S. list of bulletin board numbers. This is a directory of dial up systems maintained by the the Public Access Message System down in California. While a decent thing to have, this one is easily a year old and many of its numbers are no longer extant upon the cosmos.

Our own Computing Now! BULL system is, in fact, in there, but at the wrong number. It's listed as being "sexually oriented"... hmmm.

In short, the manual is a dog if you want to burrow into the workings of the card and apply it to your own programs.

Control Z

If you buy one of these things you'll discover that control Z is used to hang up the phone and end a session.

Among the SSM card's attributes is its size. The compatible Hayes Micromodem II would take two hands to hold it and its attendant power supply.

If you want a very clever, sophisticated modem for your Apple compatible system you can do little better than a Hayes Micromodem II. If you want one to use exclusively with a packaged smart terminal program like ASCII Express Pro or VisiTerm and want to shave a hundred dollars off the number beside where they have you sign your name you will probably do as well with an SSM card. It is very similar to the Hayes in most of the important respects.

However, if you like to write tricky programs that play with the low level hardware aspects of the system be prepared to find the SSM highly under documented. It'll do all the right stuff... but you'll have to guess how.

The SSM smart modem card is available from a number of distributors for about four hundred dollars. We got ours from Supertronix, 279 College Street, Toronto, Ontario M5T 1S2. Also available is Transcend, a smart terminal package designed for it.

Get SMARTS

If you'd like to have programmable smart keys on your computer but lack both the programming and the keys you need SMARTS. Working with what you've already got, it converts your dumb, primitive electro-mechanical lashup of a keyboard into an intelligent primitive electro-mechanical lashup of a keyboard. One small step for man...

by Steve Rimmer

One of the least enjoyable aspects of using a computer is in having to type. Most users don't mind typing in stuff that means something . . . for example, a new program or a treatise on the meaning of feet . . . but having to lay the same commands on the computer all the time is a drag.

Fortunately, this can be done away with. As owners of some of the more sophisticated systems probably already know, a computer's keyboard can be equipped with what are called programmable smart keys. These are actually just keys which emit characters which are meaningless to the operating system *per se*, but

can be interpreted as something later on through the bytes. So, for example, we might tell the machine that whenever it turns up character number two hundred it should print the string DIR B:WOMBAT.*

This is fairly useful, because you can program your most used commands into function keys and then just hit the function keys when you want to make things happen.

Sadly, many systems don't have smart key facilities. Equipped with mere QWERTY type keyboards, they cannot dazzle the fingers with single stroke manipulations. This is a real shame, because smart keys look really sharp. As such, we herewith present SMARTS, a simple routine for adding

smart keys to a basic CP/M based system.

Intelligence

Making the keys on your keyboard smart is . . . at least conceptually . . . not a difficult thing to do. In this case we are going to have to have the software interpret control characters, inasmuch as the standard typewriter style computer keyboard doesn't have any other useful inessential keys to play with. However, this technique will work for virtually any key values and if you have some unused keys you want to define as being smart you'll be able to load their values into the accompanying program with no trouble.

There are, fortunately, a number of control characters which have no particular meanings under CP/M. You'll want to avoid defining control H . . . it's the backspace . . . control M . . . carriage return . . . and control C, X, R and L. Control Z is occasionally useful, and you'll upset things if you can no longer send control S and P. However, the rest of the range is free for meddling with.

The SMARTS program installs itself in the character handling routines of CP/M and waits . . . drooling . . . for hapless characters to come by. Whenever it gets one, it scrutinizes it to discern whether it matches any of the ones it is supposed to be translating. If it sees that it is innocent it simply sends it on its way.

If it gets a match, however, it gets the name of the command it is supposed to interpret the character as and places it in the CCP console buffer, tricking the mindless creature into believing that it has been given a legitimate command from the keyboard. Then it hands control over to the CCP, which processes the command and does whatever it's supposed to do.

There are several catches in all this, however. The first one is that this code cannot be set up simply as a program. If it were to live down where programs normally reside, the first time it called for a program to be run it would be overwritten and the system would hang.

Secondly, it must interpret characters after they have been gotten from the keyboard. This, in effect, means that it must intercept the call to the console input routine after it has returned clutching its character. In fact, we looked at how to do this in "CONIN The Barbarian" in the January issue of CN!

Finally, it has to boot the program called for by the smart key routine. This is also a bit tricky . . . we found out how it works in "Polish That Buffer" in February.

The source shown here may look a little weird because it actually consists of a program within a program. The main code is just a support routine which keeps things tidy for the real works, which begin at the label "SOURCE". As we've seen before, this stuff is what is called relocating code.

In order to make this thing work properly we must first off stick it somewhere where it won't get hurt. In other words, it must go to live above the transient program area. This means either putting it above CP/M entirely or sticking it in a hole somewhere.

When developing relocating code I usually create an artificially small system with MOVCPM and make the program hide above that. For example, if you have a

sixty-four K computer and you make a fifty-six K CP/M system to run in it, you'll have eight K of RAM starting at 0F000H to play with . . . gallons more than you need for most applications.

This is a bit wasteful in real life, though, and for small relocatable things like this it's generally not necessary. Most CP/M implementations have several *holes* in them, that is, areas where there is no active code. You can usually find these with DDT.

The best place to start looking is right below the BIOS. To do this, invoke DDT and do an L0. This will give you something like JMP EC03 . . . that's the jump to the warm boot vector in the BIOS jump table. Round that down to the nearest page, EC00 in this case . . . and you've got the start of the BIOS. Check out the memory directly below this and you'll likely as not discover some vacant real estate. After you've got the program working on a small system change the DEST equate to make it relocate into this tract of bytes and see what happens.

Absolute Control

In looking at the program in detail you'll find that it breaks down fairly simply into a number of functions. When you invoke it the first time, it will load the relocating part of itself into the hopefully otherwise unused up-

per RAM area and patch itself to it. It will also display a menu of the current key definitions.

Subsequent runnings of the program will toggle the smart keys on and off. However, since we don't want to repatch CP/M each time . . . this can cause unpredictable results . . . the support program checks to see what's happening up in high RAM before proceeding to move in the relocating code.

In fact, the program works by altering the BIOS jump table. The address which normally points to the BIOS routine for getting characters is replaced with the value of DEST . . . which is the beginning of the relocated code. This routine is designed to confuse the system into calling the CONIN routine and then returning to the table matching code rather than the caller of CONIN. It does this by fudging the stack and making CONIN execute a return to the wrong address . . . which will do its stuff and then jump back to the caller.

There's a more detailed explanation in the January article if you're interested in the grotty details. Having laboured over the concoction of this, however, I've subsequently been quite happy to simply accept that it works.

The table scanning code itself is fairly simple. It compares the character in the ac-

Get SMARTS

cumulator with the first byte in each of the table entries. If it gets a match, it loads the subsequent characters in the entry into the CCP buffer and boots things. Otherwise, it does a jump to the return address of the caller.

The table itself may look a little weird. In fact, what all that code means is that, to begin with, the table relocates along with the rest of the code and, secondly, all the entries are padded out to sixteen characters long no matter how many characters are actually in them. The expression: `DS 16 - (($ + OFFSET) - TABLE)` tells the assembler to add sixteen minus the length of the entry bytes of space to each entry. This, while a bit wasteful of space, makes the scanning code a great deal simpler and faster.

Hacking It

Needless to say, you don't have to define things the way I have. You can have as many entries into the smart key table as you like. The value for KNUM, up at the top, should reflect the number of keys you want

to enlighten. You can install any definitions you like in the table, provided you keep to the form shown here and that you keep the strings down to fourteen characters or less.

You will also have to change the DEST value for your system, as we've seen.

If you do have function keys on your keyboard you can translate them if you fancy. In the likely event that your documentation fails to mention what they emit, you can use a small BASIC routine to discover their character values.

```
10 C$ = INPUT$(1)
20 PRINT ASC(C$)
30 GOTO 10
```

Very often they'll turn out to be doing control characters.

If you find that your keys are actually doing high order characters . . . those with values above 128 . . . you'll probably want to change the HI: routine to have the menu make sense. Make the CONTR string read:

```
CONTR DB CR,LF,TAB,TAB,'Function $'
```

and the line below DISLOOP go:

```
ADI [n] + 'I'
```

where the little n is the value spewed out by

your F1 key. Obviously, you'll want to put the values of your function keys in the table area.

Having gotten everything patched and ready to rip, assemble and load the code and run the program. You should get the message that tells you that the keys are enabled. If you hit one of the control or function keys that you've placed into the table, the appropriate program should boot up.

If you run SMARTS again you'll get a message that says that the keys are disabled and all should be as it was. Run it for a third time and the keys will come back.

If you do a lot of work on your system at the command line level SMARTS will make your life much more karmic.

At the very least it will save your disks the hardship of looking for programs like MBAISC, DIE, PIPP and the other offshoots of typing a bit too fast.

ANNOUNCING A VERY SPECIAL, "SPECIAL"

Personal Computer Guide was first published in April, 1983 and contained reprints of the thorough, highly-respected reviews of 15 personal computers from *Electronics Today* magazine plus additional articles targeted at the same market.

The extraordinary success of this Special has led us to produce a new edition, this time carrying reviews of recent systems tested by both *Electronics Today* and *Computing Now!* magazines — over 20 reviews are planned.

This edition will be printed on glossy stock, be approximately 100 pages and be priced at \$3.95

To Be Published May 1984

Search For Wordstar

The capacity of WordStar to do multiple searches and search and replace functions in large documents can be extremely powerful if you get into the subtleties and nuances of its workings. Here's a quick scan.

by Steve Rimmer

One of the really splendid aspects of WordStar is the hierarchy of its features. You can get into using the program with a minimum amount of sweat... and as you have need for special capabilities you can check 'em out on the menu... or even in the manual if you acquired your software legitimately... and get them together.

The search and replace features of this popular word processor are usually one of the last things users of it get into. Having the power to thoroughly garbage a document if used incorrectly, the search and replace is one of those things that most people would rather leave tucked away in a cobweb-encrusted corner of the Q menu for future generations to find.

This, of course, is cowardly and really a drag, inasmuch as there is an awful lot that can be managed with these things. We'll get into some of them presently.

Fetch, Fido

The two basic incarnations of the search and replace features of WordStar are called by hitting control Q and F and control Q and A respectively. This will allow you to specify what you want to be searched for, what you want it replaced with and how the process is to work.

The search only, control Q and F, is fairly straightforward. It will find the first occurrence of the string you tell it to look for in your file starting with the present location of the cursor. Control Q and R and control Q and F followed by a string... "Bandicoot"... will find the first time "Bandicoot" shows up in your document.

There are, however, a number of options one has in doing searches. You can do a "B" search, for "backwards". The system can also be instructed to ignore the case of the thing being searched, so, for example, it would find "Bandicoot" and "bandicoot" if told to work in this mode. Finally, it will let you specify a search for whole word only. Thus, it would find "bandicoot" but not "bandicoots".

If you do a control Q and A the program will search for something and replace it with something else. This is useful, for example, if you discover that you've just created a sixteen K document with the same word spelled wrongly throughout it. You would do a control Q and A, the misspelled word... "futbath", the proper spelling... "footbath", and then the options G and N. This means that you want a global search and you'd rather not be asked about each replacement. If you omit the "N" the system will stop at each match in the text and ask you if you want to replace it.

There is a very useful trick involved in this. WordStar likes an audience, and will happily format the text as it goes, displaying each replacement on the tube. This gets dull very quickly. If you hit a carriage return while it's happening, however, all screen activity will stop until the ordeal is completed, at which point WordStar will show you the bottom of your document. This speeds things up considerably.

Don't be alarmed if the disk drives run a lot during a long global search and replace... WordStar keeps its scratch files and pointers on disk to tell itself where it is in your document.

In Control

One of the most useful aspects of the searching functions of WordStar is that they will also search for control characters. These are unprintable symbols which cause the text to behave in a certain way. For example, every time you put a hard carriage return in your text... indicated by a left arrow symbol on the right hand side of the screen... you are actually installing two characters in your file. These are called carriage returns and line feeds.

Manipulating the control characters can make changing formats a short walk in the grass...

Control characters are often referred to as control keyed alphabetic characters. You use these to move around the screen and so the other functions of WordStar. However, it's important to keep in mind that the control characters you type are all trapped by WordStar and used to do other things... they don't normally go to the screen directly.

Manipulating the control characters in your documents can make changing their formats a walk in the short grass. For example, suppose you want to take a document like this article, with each paragraph following the last, and install a blank line between each paragraph. You could do it by hand, but you could also change the control characters around.

A carriage return is, in fact, a control M. A line feed is control J. Thus, to get the blank lines in what you'd have to do would be to find all the occurrences of control M control J and replace them with two pairs of control M and control J.

The way you tell WordStar to accept a

control character literally, rather than interpreting it as a function command is to hit control P and then the character you want to make happen. However, if you type a control P control M you will find that the command line won't show you a control M symbol, but, rather, will move the cursor to the left hand side of the screen, the usual result of a control M, or carriage return. A control P control J will move it down one line. While a bit messy to look at, this is cool and means that WordStar is accepting your characters properly. Most other control characters will be displayed symbolically.

If you want to find the soft ends of lines... that is, where WordStar has wrapped your text around for you, you can search for control N. If you have a need for unformatted text... that is, a document with no returns... remove all the control Ns. You can remove characters with search and replace by having WordStar search for something and replace it with nothing. When it says "REPLACE WITH" just hit return.

This will leave you with one very long line.

We use the search and replace quite a lot to replace the pseudo tab characters in a WordStar file with real ones. If you hit the TAB key when WordStar is in its document mode you'll actually get five regular old space bar spaces. A real tab, however, is a control I character, which is customarily interpreted as being eight spaces. Thing is, the character itself is only one character wide, so it can be deleted with one operation. More to the point, our typesetting equipment... and many printers... are happier with real control I tabs.

You can have control I tabs by simply searching for five blank spaces and replacing them with control I. This will only affect the pseudo tabs you've put in, by the way, because, while there would seem to be spaces at the ends of paragraphs WordStar regards these areas as being empty of all characters and thus won't try to do anything with 'em.

There are other hidden mysteries of control Qs. For example, if you do either a search or search and replace for one occurrence of something... that is, without the G option... you can make WordStar repeat the search for next occurrence along in your file if you hit control L. You've probably wondered what that one was for.

Along the same lines, you'll find that if you hit a control R on one of the command lines of the searching menu... such as when it's asking you what you want it to search for, it will bring up the last string you used. You can edit this if you feel a need to.

Product Mart *Where Buyers Find Sellers*

Advertising in the **Product Mart** section allows you to reach over 30,000 Canadian readers nation wide for \$1.00 per word (minimum 25 words). Please contact us for further details on the various sizes and styles available.

WHAT DO YOU DO?

Send us your typewritten or clearly printed words, your permanent address and telephone number and your money (no cash please). Make your cheque or money order payable to Moorshead Publications. We're at Suite 601, 25 Overlea Blvd., Toronto, Ontario, M4H 1B1.

WHAT DO WE DO?

We typeset your words (and put the first word and your company name in **BOLD** capital letters). If we get your message by the 14th of the month, it will appear 1½ months later. For example if we receive it by October 14th you and our readers will see it in the December issue.

DOSDIAL

The Apple Terminal Package

There are plenty of terminal programs for the Apple II and its emulators. Some dial, some download, some even nurse your poor motherless wombats when they're lonely and scared at two in the morning. However, only DOSDIAL is this splendidly cheap.

DOSDIAL is a hybrid Applesoft and machine code package for fast operation and easy modification. It features a phone number library and automatic dialing. It operates on any fruit with a PDA 232C serial card and an autodial modem. A complete source file of the assembler code is included to allow it to be quickly patched for other serial cards.

Search For Wordstar

If you enter a number as an option instead of one of the letters the thing wants the search and replace will take place that number of times. This, in itself, offers one a useful trick because it lets you do a search to the end of your file as opposed to a global search if you want to.

If you call for a global search WordStar moves its cursor up to the top of your file and lets it rip. However, you may only want to work with the second half of your document. In this, case, do a non-global search and call for it a huge number of operations when the menu asks for options. This will take you down to the end of your file and throw an error message because the string you've been looking for won't be there that number of times. Hit escape to put the software back in its place.

Finally, if you are in the middle of a long search and you suddenly realize that you've made the mistake of your entire cosmic existence you can interrupt the process by hitting control U and then escape.

Very Advanced Tricks

There are a few other tricks which WordStar has built-in to make its searching capabilities even more useful. Among the neatest is the availability of place markers.

It's very often the case that you'll be tooling through a document and you'll want to go somewhere else and then return to where you were. For example, you may

find a frequently misspelled word that you want to search and replace into compatibility and then continue looking through the text. This is a job for... the mighty place markers.

Actually, they're really rather humble. If you put the cursor somewhere and do control K followed by a number from zero to nine you will discover that there will appear a place marker in your text. It will be the number you've typed surrounded by arrow heads. If you then go somewhere else and do a control Q and that number the cursor will find your marker. You can kill a marker by moving the cursor to it and doing another control K and its number.

You can, obviously, have as many as ten markers in your text at a time. You can move 'em around as much as you like. They're particularly useful in editing programs with WordStar, as they let you find particular parts of your trackless code without a lot of searching and guessing.

Finally, there is the searching which works in conjunction with SpellStar, WordStar's pet spelling checker. This is a specialized searching function capable of looking for only a single character, this being the one SpellStar uses to mark words it doesn't recognize. The character used is a null, or control "@" sign. It's called up by control Q and L.

When you run SpellStar it "marks" your file with these nulls and then pops you back into WordStar to do some fixing. It's actually

fairly convenient. However, finding the nulls would be a bit tedious. In fact, a null is one of the few characters which you can't search for or replace with under the normal control Q functions.

If you use the control Q and L function, WordStar will pop you along from error to error, allowing you to fix your mistakes. However, it will also, optionally, swallow the word it's marked and add it to a dictionary. Thus, for example, it can create a dictionary of specialized words not in its file as you roll.

Find It

Using the searching features of WordStar effectively will make handling large documents a great deal easier. It will also make using this package a lot more efficient as a program source editor and, if you are working with a system that has small disks, such as the Apple II under CP/M, it will allow you to make better use of the scratch file space available when you're using large source files.

However, the best part about this aspect of WordStar, is that it looks so neat when its working. It fairly clips along, doing all kinds of work that you know would take you hours and just making life wonderful.

We recently tried having do a global replace to remove all Liberal politicians and insert strings of random punctuation... I think it was successful, but it's so hard to tell for sure.

Word Processors Survey

Reed to papyrus, stylus to clay, chisel to stone, pen then metal to paper, and finally ASCII to output... the expression of man's thoughts has come a long way.

No matter what micro computer you swear by, there's probably a word processor for it, buried deep in your dealer's shelves. The more popular your micro is, the more likely there's a varied selection to choose from.

Why do you need one? If you do any writing at all, you'll likely appreciate the fact that you can manipulate your prose until it looks exactly like you want it to before printing it out. This saves untold reams of paper and gallons of white-out.

Justification's a blast. With a typewriter, a good guess is necessary to determine the exact centre placement of a line or paragraph of text. On most word processors, a two key command will do the same thing in seconds. Fill justification, where creative padding permits each line to be the exact length is an impossibility on a manual typewriter. Again, a few deft jabs at whatever keys the program's manual tells you to hit will produce the desired effect.

Perhaps a word processor's most appealing feature is the 'search and replace' function, where words or sentences can be sought out and optionally replaced by whatever's felt to be a better way of putting things.

This is a survey of a number of the more popular word processors presently bearing price stickers at your local software store. You'll likely have to try a number of them out personally... and suffer the slings and arrows of salesmen... before finding one that feels comfortable, but you'll wonder how you lived without it after making a place for it in your software collection.

Super-Text Professional

Computer(s) Supported: Apple II, //e, Commodore 64
RAM Required: 64K
Special Character Sets: Characters for 80 columns
80 Columns On-screen: Yes; through software
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap:
Justification: Right, left, centre
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Muse Software
Available From: International Marketing Services
Price: \$124.00
Other: Split screen option

Quick Brown Fox

Computer(s) Supported: VIC-20, Commodore 64, IBM-PC
RAM Required: 4K (VIC), 64K (C64)
Special Character Sets: No
80 Columns On-screen: Yes, with Data 20 Video Pak
Search and Replace: Replace only
Block Moves: Yes
Automatic Word Wrap:
Justification: Left
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: The Quick Brown Fox Company
Available From: Mr. Software
Price: \$99.95
Other: Boiler Plates

Bank Street Writer

Computer(s) Supported: Apple II, Atari, Commodore 64
RAM Required: 48K
Special Character Sets: No
80 Columns On-screen: No, uses scrolling
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Broderbund Software
Available From: Softsource
Price: \$59.95
Other: "Unerase" function

Magic Window II

Computer(s) Supported: Apple II, //e
RAM Required: 48K
Special Character Sets: Yes, used with 70 column feature
80 Columns On-screen: Yes, with software or optional firmware
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Artsci
Available From: Exceltronics
Price: \$189.00
Other: Menu-driven

Ace Writer

Computer(s) Supported: Franklin 1000, 1200
RAM Required: 48K
Special Character Sets: Yes, used with 70 column feature
80 Columns On-screen: Yes, with software or 80 column card
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Artsci
Available From: General Electronics
Price: \$49.95
Other: A licensed version of Magic Window II

Apple Writer //e

Computer(s) Supported: Apple II, //e
RAM Required: 64K
Special Character Sets: No
80 Columns On-screen: Yes, with appropriate firmware
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes; may be disabled if desired
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Apple Computer
Available From: Exceltronics
Price: \$210.00
Other: Help screens, split screens

Perfect Writer

Computer(s) Supported: Most Z-80 and 8088 based systems
RAM Required: 64K
Special Character Sets: No
80 Columns On-screen: Yes
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: Optional; Perfect Speller
Manufacturer: Perfect Software
Available From: Computer Junction
Price: \$249.00
Other: Multiple file display

Word Processors Survey

WordStar 3.3

Computer(s) Supported: Most Z-80 and 8088 based systems
RAM Required: 48K
Special Character Sets: No
80 Columns On-screen: Yes
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: Optional; SpellStar
Manufacturer: MicroPro
Available From: Exceltronics
Price: \$589.00
Other: On-screen help menus

Pen-Pal

Computer(s) Supported: Apple II, //e
RAM Required: 48K
Special Character Sets: No
80 Columns On-screen: No, uses scrolling
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: No
Justification: Left, right
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Howard W. Sams
Available From: Lenbrook Electronics
Price: \$84.95
Other: Supports modem transfers

Word Handler

Computer(s) Supported: Apple II, //e
RAM Required: 48K
Special Character Sets: Yes; 66 column format
80 Columns On-screen: 66 columns in software, or 80 scrolling
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Silicon Valley
Available From: Gladstone Electronics
Price: \$229.95
Other:

Screenwriter II

Computer(s) Supported: Apple II, //e
RAM Required: 48K
Special Character Sets: Yes; 70 column software
80 Columns On-screen: Yes, in software
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Sierra Online
Available From: Softsource
Price: \$139.95
Other:

Benchmark

Computer(s) Supported: Apple, IBM, other CP/M or MS-DOS systems
RAM Required: 64K
Special Character Sets: No
80 Columns On-screen: Yes
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Metasoft
Available From: Softsource
Price: \$479.95
Other: Help menu, merge capabilities

VisiWord

Computer(s) Supported: IBM-PC,
RAM Required: 128K
Special Character Sets: No
80 Columns On-screen: Yes
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: VisiCorp
Available From: The Original Software Source
Price: \$369.00
Other: Software print spooling, split screen

PFS:Write

Computer(s) Supported: IBM-PC, Apple //e
RAM Required: 64K Apple, 128K IBM
Special Character Sets: No
80 Columns On-screen: Yes
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: PFS
Available From: The Original Software Source
Price: \$126.00
Other: Help screens

MacWrite

Computer(s) Supported: Apple Macintosh, Apple Lisa 2
RAM Required: 128K
Special Character Sets: Yes; many and varied
80 Columns On-screen: Yes
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Apple Computer
Available From: Apple Canada
Price: Presently accompanies the computer. \$150.00 after introductory period.
Other: Easily interfaceable with MacPaint

The Writer

Computer(s) Supported: Apple II, //e, IBM-PC
RAM Required: 48K
Special Character Sets: No
80 Columns On-screen: Yes
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes; IBM. Upper case letters shown in inverse on 40 column Apple
Spelling Checker: Optional for IBM - The Speller
Manufacturer: Hayden Software
Available From: Local dealers
Price: \$65.00
Other: Includes mail merge, help screens, IBM version supports colour

PIE: Writer

Computer(s) Supported: Apple II, //e, IBM
RAM Required: 48K
Special Character Sets: No
80 Columns On-screen: Yes; IBM, Apple firmware cards supported.
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes; IBM. Upper case letters shown in inverse on 40 column Apple
Spelling Checker: Optional; PIE:Speller
Manufacturer: Hayden Software
Available From: Arkon Electronics
Price: \$187.50
Other: Integrated telecommunications capability, mail merge

Palantir

Computer(s) Supported: Most CP/M and MS-DOS computers
RAM Required: 56K
Special Character Sets: No
80 Columns On-screen: Yes
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Designer Software
Available From: A.M.I.E.S.
Price: N/A
Other: Accompanying mail merge program

SmartWriter

Computer(s) Supported: Coleco Adam
RAM Required: 80K
Special Character Sets: No
80 Columns On-screen: No; uses scrolling
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Coleco
Available From: Gladstone Electronics
Price: \$999.00; integrated with Adam
Other: Undo feature

PaperClip

Computer(s) Supported: PET, Commodore 64
RAM Required: 64K
Special Character Sets: Yes, with 80 column software
80 Columns On-screen: Yes, either software or hardware
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: Optional integrated SpellPack
Manufacturer: Batteries Included
Available From: Batteries Included
Price: \$99.00; \$149.00 with SpellPack
Other: PET versions on ROM

Script 64

Computer(s) Supported: Commodore 64
RAM Required: 64K
Special Character Sets: No
80 Columns On-screen: Yes, through software
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: May be purchased or user-compiled
Manufacturer: Richvale Telecommunications
Available From: Richvale Telecommunications
Price: \$129.00
Other: Includes mailing list program

WordPro

Computer(s) Supported: Commodore PETs, Commodore 64
RAM Required: From 32K to 96K depending on hardware
Special Character Sets: No
80 Columns On-screen: Yes, depending on hardware
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: Optional; SpellPro, SpellRight Plus
Manufacturer: Professional Software, Pro-Line Software
Available From: Local Commodore dealers
Price: Varies according to version
Other:

Volkswriter Deluxe

Computer(s) Supported: IBM PC, IBM XT
RAM Required: 64K
Special Character Sets: No
80 Columns On-screen: Yes
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Lifetree Software
Available From: Mid Canada Software
Price: \$267.00
Other:

HES Writer

Computer(s) Supported: Commodore 64, Vic 20
RAM Required: Depends on hardware
Special Character Sets: No
80 Columns On-screen: No
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Human Engineered Science
Available From: Mr. Software
Price: \$52.95
Other: Chain printing, wildcard search

Cut and Paste

Computer(s) Supported: Commodore 64, Apple II, Apple IIe
RAM Required: 48K to 64K
Special Character Sets: No
80 Columns On-screen: Depends on hardware
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Electronic Arts
Available From: Mr. Software
Price: \$74.95
Other:

Homeword

Computer(s) Supported: Commodore 64, Apple II, Apple IIe
RAM Required: 48K to 64K
Special Character Sets: No
80 Columns On-screen: Depends on hardware. High res "window"
Search and Replace: Yes
Block Moves: Yes
Automatic Word Wrap: Yes
Justification: Left, right, centre, fill
Character Insert: Yes
Upper and Lower Case: Yes
Spelling Checker: No
Manufacturer: Sierra Online
Available From: Mr. Software
Price: \$69.95
Other: Uses icons

Forth

If you have found yourself up to your clavicle in languages of late you will no doubt have heard a lot of very deceptive things about FORTH. Some of them may even be true. You might want to compare it with this look at FORTH... which is all true.

by Ian Heppell

There has been much debate recently about which computer language is most suitable for use on small computers. Much of this debate is fueled by the deficiencies of BASIC ... its lack of modularization and of control structures, slow execution, lack of portability and the like. BASIC is not a good language for even moderately large programs. The question is, how should it be replaced?

The usual first step away from BASIC is toward assembly language. While assembly language is irreplaceable for some applications, it is difficult to use effectively. Even the fancy macro assemblers fall far short of being "high level", so a program developer is certain to spend a significant amount of time worrying about low level operations and, of course, debugging. Above all, assembly language is not portable.

True compiled languages such as Pascal, C, and FORTRAN are becoming realistic alternatives to BASIC on the micro computer. These offer varying degrees of portability and quality, but are typically monolithic black boxes with minds of their own. While this situation is improving, they still generally require two disk drives, which will be used very heavily on a typical sixty-four K machine. The compiled code is often not as space and time efficient as one would like.

The advantages of FORTH are many. It is often faster than compiled languages or poorly written assembly code. FORTH actually includes the ability to create machine code for time critical routines. FORTH is compact ... applications generally don't extend the standard eight kilobyte core system very much. FORTH is an extensible language ... if the language is missing something you want, you can add it. In fact, every FORTH program is simply an extension of the language. For this reason ... and because of it ... a FORTH system is integrated. The operating system, text editor, file handler and even the FORTH interpreter itself are all written in FORTH. The programmer has control of everything.

This article will provide an introduction to the largely unexplored world of FORTH.

Fundamentals

Learning FORTH involves coming in contact with a number of new concepts. Most of these can seem confusing and even overwhelming at first glance, but running into them in the proper order can help a lot. In particular, there are two concepts on which most of FORTH is based, the *stack* and the *word*.

A stack is basically a pile of numbers. You *push* numbers on a stack and *pop* numbers off. Both these operations involve the top of the stack, so that in order to pop the bottom of the stack, you must first pop all the numbers on top of it. In technical jargon, a stack is a LIFO... last in first out... queue. That just about says it all.

Stacks are used by most languages, although the programmer rarely needs to be aware of it. In FORTH, stacks are the fundamental method of passing information between routines. For example, you may have a routine that pops the top element of the stack, squares it, and pushes it back on the stack. Any other routine could use this feature by simply pushing the number it wanted squared and calling the squaring routine.

FORTH routines are called *words*. The name of a word can be any sequence of ASCII characters except blank, null, or return. For example, ". ", dot quote, is a FORTH word that prints a character string to the terminal. Such liberal use of non-alphanumeric characters can make reading a FORTH program difficult for the beginner, but you get used to it pretty quickly.

A word is either a string of machine code instructions, a variable, a constant, or a collection of other FORTH words. Once a word has been defined, it can be used in the definition of other words. Thus, words become more high level as they are built up of higher level words, until the whole program is represented by one word. Even these programs can be included as parts of a kind of a meta-program, as is the case of the FORTH system itself. FORTH can be made to work at an arbitrarily high level.

Arithmetic in FORTH

In any introduction to FORTH I've seen, a lot of fuss has been made of *post fix* notation and its relative merits. You may have run across post fix notation if you've ever had to use a Hewlett-Packard calculator. It is basically a way of representing an arithmetic expression so that the operation comes after the two operands. For example, $3 + 4$ becomes $3\ 4\ +$, and $5 * (6 + 7)$ becomes $5\ 6\ 7\ +\ *$. Notice in the second example, post fix requires two fewer characters than "in fix", or regular notation.

The real advantage to using post fix notation on a computer is that the expression can be calculated from left to right. In the second in fix expression, the computer has to remember the multiplication, and not perform it until the addition is taken care of. This is a complex task when implemented for arbitrarily complicated expressions.

In fact, all computer languages that understand in fix notation must convert in fix expressions to post fix expressions before they can calculate them. The program that does this is a parser. FORTH and Hewlett-Packard calculators have no built-in parsers, so users are forced to use post fix notation. This saves the computer space and time at the expense of increased effort on the part of the programmer.

In the case of FORTH, post fix notation has a real advantage of working perfectly with the language's use of the stack. It is very natural for routines to contribute to an arithmetic expression by simply leaving their results on the stack. Using our squaring example from earlier, we could calculate $X^2 + 5$ with

80 CONSTANT MAXWIDTH

You might also want a variable that kept track of your current left margin. You would define it...

5 VARIABLE LMARG

To use a variable, you would:

LMARG @

to fetch... @... the value of LMARG and put it on the stack, or you would:

N LMARG !

to store... !... the value N in LMARG. In other words, the main difference between variables and constants in a FORTH system is that execution of a constant puts the value of the constant on the stack, while execution of a variable puts the address of the value on the stack, which can then be referenced.

How FORTH words call each other: High level words call lower level words until machine language is reached at the lowest level.

X SQUARES 5 +

In other words, the use of post fix notation is ideally suited to FORTH, although if you really wanted to use in fix expressions, you could extend the language to give you the capability.

Defining New Words

The words in a FORTH system are stored in what's called a dictionary. The words are basically stacked, with each word defined in terms of the words underneath them. Words can be linked together in *vocabularies*. For example, a set of words can be used for editing source text, and can be grouped together in a vocabulary. This way, the editor words can be ignored if no editing is going on.

The simplest types of words are constants and variables. These are pretty much what their names imply. If you were writing a text editor for an eighty column screen, you might want a constant that told you the maximum width of your screen. You would define it like this...

Thus, variables allow a change of value at the cost of a little execution time.

The most important words you'll create are those that perform some kind of manipulation on data. These can be compiled into the dictionary in several ways, depending on what type of word you are defining. The most common is the *colon definition*, so-called because the colon word in FORTH is used. The colon creates a word that is defined in terms of other FORTH words. For example:

: SQUARE DUP * ; (n - n)

would add our word SQUARE to the dictionary. A few comments are in order.

To begin with, the colon puts us into compile mode. The next string will be the name of the new routine... SQUARE. DUP is a word that duplicates the top entry on the stack, leaving two numbers where there was only one. The * means multiplication. The semi-colon takes us out of compile mode. This is the end of the definition. The left parenthesis indicates a comment, delimited by a right parenthesis. The "n --- n" is stan-

Forth

dard notation describing what the word does to the top of the stack. In this case, the word takes a sixteen bit number, *n*, and leaves a sixteen bit number.

When the FORTH interpreter sees the colon it makes an entry on top of the dictionary with the name of the word to be compiled. It then scans the rest of the line and pulls out the words that will make up the definition. For each of these words the interpreter finds its address in the dictionary and puts a pointer to this routine in the definition. This process continues until the semicolon is reached, at which the point the definition is completed.

Thus, a colon compiled word is basically a string of pointers to other words in the dictionary. These pointers *thread* down the dictionary until true machine code is reached. This is why FORTH is classified as a threaded language.

Let's get back to our example. Let's say we wanted a list of squares of the numbers one through ten. A word to do that would look like this:

```
: LISTSQ 11 1 DO 1 SQUARE . CR LOOP ; ( - )
```

In this word, the 11 and 1 are the parameters of the DO loop, which is a little like the FOR NEXT loop in BASIC. The "I" is a FORTH word that puts the index of the loop on the stack, in other words, the numbers one to ten. The dot is a FORTH word that prints the top number on the stack. CR performs a carriage return and LOOP is the end of the DO loop, like NEXT in BASIC.

Notice the way LISTSQ supplies SQUARE with parameters by just leaving them lying on the stack. Again, this works nicely with the post fix notation that SQUARE uses to perform its multiplication.

Looking More Closely

When you load a FORTH system, there won't be much fanfare... maybe just a copyright notice and a cursor. You are in the infinite loop called the interpreter which is waiting for you to enter a line. When you do so, the interpreter scans the line for a string and attempts to execute it. If it can't, it checks to see if the string represents a number, and if it does, it pushes it on the stack. If the string is neither a word nor a number, you'll get an error message.

Most words execute in a very straight-

forward way, as in the case of SQUARE... it goes away, does something, and then returns. Other words have more subtle effects, such as changing the value of a system variable. A good example of such a word is HEX, which causes FORTH to read and write all numbers in hexadecimal format. In fact, HEX simply loads the system variable BASE with the number sixteen. Any number can be placed there and give legitimate results... although the common modes are base two, eight, ten, and sixteen.

Still other words cause FORTH to leave execution mode and enter compile mode. The example we have seen is the word ":"... the colon. In compile mode, the interpreter reads and analyses strings in the same way, but instead of executing them, it passes the details of the string to the compiler, and the compiler enters the appropriate information in the dictionary. Eventually, a word will be found that will instruct the interpreter to leave compile mode, complete the definition, and return to execution mode. In the case of a colon definition, this word is the semicolon.

The whole FORTH system is accessed from the interpreter. This includes the operating system, editor, assembler and whatever other environments you might have in your system. This simplicity is what attracts many people to the language.

Easily the most annoying aspect of a standard FORTH system is its primitive file system. In fact, it's hardly a file system at all, but rather a bunch of contiguous pages, or *screens*, of text. FORTH treats the disk as a large block of memory which it can access five hundred and twelve or one thousand and twenty-four bytes at a time. There are, in fact, no files.

FORTH is becoming a popular choice for sophisticated industrial applications

This is a "guess the number" game written by the author in FORTH.
The computer invariably wins.

As I mentioned, disk storage in a standard FORTH system is broken up into screens of one half or one kilobyte, usually dependent on the width of your screen. FORTH text can be stored and edited in these screens, and then read by the interpreter just as it would be read from the keyboard.

Go Forth

In summary, FORTH has many unique advantages, especially on a small computer. It is compact, fast, modular, integrated and portable. It is reasonably easy to learn and is available on virtually every micro you're likely to use.

FORTH's weaknesses are its poor readability and lack of built-in file capability. Note, however, that the former problem can be reduced with careful coding and the latter can be eliminated with the addition of a user written file system. In fact, FORTH can become just about anything you want it to be. If you're still looking for a language system you can live with, FORTH may be worth a try.

The Doctor's Little Black Computer

Despite the advances in medical technology of late, the practicing physician uses very little computer power in the running of his office. Here's a look at how this is changing.

by Bruce R. Evans, M.D.

Chances are, next time you're in your doctor's office, you'll see a new instrument. It won't be something else to poke, probe or prod you. It won't be a pain-free needle or a painful scale. No, it'll be a computer.

For years, hospitals have been using computers to automate paper handling tasks. Space age computer controlled X-ray devices plot out your brain, liver and almost anything else you have. Most lab tasks are now routinely handled by computer controlled equipment. In fact, many times it's easier and cheaper to do a whole battery of computer controlled tests than to do one or two manually. Until now, however, very little of this has spilled over into your family doctor's practice.

To better understand this lag, you must know what goes on in a doctor's office. Oh, I don't mean the medical procedures involved in a yearly checkup or in having your Space Invaders wrist treated. I mean the other half that you don't know about until your doctor's secretary phones up to tell you that your insurance company didn't pay your bill. As you hear her threats to give back your appendix

THE MULTITECH LOGO IS A STANDING SYMBOL OF DEDICATION TO THE MARKET — A SYMBOL OF COMPUTER EXCELLENCE.

MULTITECH is active at the forefront of the high technology industry. With a company philosophy of bringing technology down to a level where it can be utilized by all people is reflected in the development of all products. With over 70 engineers working in the Research & Development division alone, and over 60% of MULTITECH's employees having solid backgrounds in electronic and computer engineering, MULTITECH's focus on quality in

The new generation MPF-III personal computer from Multitech represent our latest efforts at providing economical computing power. Software that can run on the Apple II/e computer can run on the MPF-III. The MPF-III also features more advanced standard hardware features than the Apple offering. Ergonomically designed with detachable keyboard and tilt and swivel monitor, the MPF-III also features wide expandability to meet increasing computer needs.

MANUFACTURING HAS BEEN CENTERED ON THE NECESSITY TO PRODUCE TOP QUALITY PRODUCTS THAT ARE LESS EXPENSIVE TO MANUFACTURE. MULTITECH HAS BEEN GRANTED OVER 100 PATENTS AND COPYRIGHTS ON NEW IDEAS AND TECHNIQUES.

The Micro-Professor line of computers have been the subject of cover stories in magazines such as Britain's Your Computer, Germany's Chip, Australia's Electronics Today International, and France's LED.

MVM 12

The ErgoVision video monitor is a work of industrial design that includes tilt and swivel capabilities and quality resolution.

- ★ HIGH RESOLUTION 12" NON-GLARE SCREEN
- ★ P31 GREEN OR C134 AMBER SCREEN
- ★ NTSC COMPOSITE VIDEO INPUT INTERFACE
- ★ ERGONOMIC DESIGN WITH FULL TILT AND SWIVEL CAPABILITIES
- ★ COMPATIBLE WITH MOST POPULAR MICROS
- ★ VIDEO BANDWIDTH OF 18 MHz
- ★ RESOLUTION OF 1000 LINES CENTRE, MINIMUM 800 LINES CORNER
- ★ SCANNING FREQUENCY OF 15750 Hz HORIZONTALLY, 55 Hz VERTICALLY
- ★ 120 DAY WARRANTY

MPF III

- 64K DYNAMIC RAM.** A full 64K of random access memory 20K of ROM is expandable to 24K.
- 80 COLUMN VIDEO DISPLAY.** The standard 80 column display is double that of most personal computers. Upper and lower case characters can be simultaneously displayed. The display also features a screen editor with the capabilities to insert, delete, or clear the screen.
- 90 KEY ULTRASLIM DETACHABLE KEYBOARD.** Besides the conventional 56 main key layout, the MPF-III comes with a numeric keypad, special function keys and user function keys.
- 36 TONE SOUND GENERATION CHIP.** The MPF-III has a 36 tone sound generation chip that can be programmed according to your musical tastes. Sounds emitted include piano, bell, gunfire, bombing or laser.
- 7 INTERFACES FOR A WIDE ARRAY OF I/O DEVICES.** The MPF-III has a standard 7 interface port configuration that gives you the ability to interface with disk drive, printer, cassette recorder, Z-80 CP/M card, Chinese character card and monitor or television.
- 3 EXPANSION PORTS FOR EASY EXPANDABILITY.** Designed with user flexibility in mind, the MPF-III offers 3 expansion slots for special user application.
- 1 APPLE COMPATIBLE EXPANSION PORT.** One Apple II/E hardware compatible port gives you total expandability.

The Slimmer floppy disk drive from Multitech is a half height 5¼" minifloppy drive that offers economical compatibility with most popular computers on the market today.

APPLE AND IBM COMPATIBLE

- Fast Positioning Time - Stepper motor and direct DC drive motor • Steel belt Drive Mechanism • Safe Media Protection track-O sensor • Write Error Protection Circuits • Half Track Capability • Forty track capability • Standard IBM PC Interface - The Slimmer provides a 34 pin standard format interface for use with the IBM PC • Storage Capacity: 250K Bytes.
- DS/DD disk drive for I.B.M. also available.

Special Function Keys

Twelve User Programmable keys each consist of four command levels, the pre-programmed functions of the first level include:

- Catalog
- Load
- List
- Save
- Delete
- Run
- Auto line number
- Auto line number Reset
- Keyboard Click Toggle
- Monitor Mode Entry Key
- Boot key for Apple port 6
- Home

The remaining 3 levels of 36 special code combinations are designed to be programmed by the user according to individual needs.

One Key Basic Feature

A total of 52 BASIC commands can be entered with the convenience of the push of a button. A key command map for replacement on the AccuFeel is provided to facilitate operation.

User Definable Keys

The AccuFeel is equipped with 10 user definable keys that utilize up to 60 bytes of memory for user defined functions. Three on board keys control definition and memory access functions.

The AccuFeel compatible keyboard adds a new world of power and convenience to Apple II computing. With more features than any other compatible keyboard on the market.

The Doctor's Little Black Computer

or take the new baby away unless you pay up, you realize there's also a business side to medical practice.

Money

In fact, the business side of medical practice has traditionally been where most of us physicians are lost. A computerized office system should be a boon to all of us. Unfortunately, until recently there was no cost efficient way of doing this. Personal computers are changing all this.

The first breakthrough has come with the hardware itself. As little as five years ago, there were no dependable personal computers sophisticated enough for the job. Oh, certainly some doctors were tinkering with their own systems but forty eight K machines with single density, single sided floppy discs weren't the solution. Printers were noisy, slow and expensive. Service facilities were non-existent. If something broke down, it had to be shipped off for weeks to some place in California or other nether region. Compatible peripherals never were unless you had a masters degree in engineering. I.B.M., Xerox and Zenith have forever changed this.

**"five years ago there
were no dependable
personal computers
sophisticated enough for
the job."**

The second problem was and still is software. Most programmers are not doctors and seldom have enough insight into medical practice to write suitable programs. Integrated packages take a lot of time and effort to put together. It has always been more profitable to write them for the hundreds of thousands of small businesses that follow standard business procedures than to write for ten thousand demanding medical practices. Programmers haven't been helped by the various provincial medical insurance schemes that have never been able to agree to a standard billing procedure that could be understood by programmers.

Let's look at where your doctor will be using his computer. The first area is in standard business applications. Accounts payable, accounts receivable and a general ledger are handled the same way whether you're a physician or General Motors. It's merely a matter of scale. There are many programs available

here but again the problem crops up, programmers are programmers. They no more are accounting specialists than they are medical specialists. My accountant would have turned grey had I used some of the early accounting packages that came out for personal computers. I still remember a salesman telling me that if I made an error in entering daily cash payments, I could correct it at the end of the month by fudging the totals a little! It's much better today.

You'll probably not notice much of a difference when your doctor computerizes his accounting. However, an efficient billing system may encourage him to bill you for items which earlier he ignored simply because it was "too much bother to keep track." On the other hand, if he finds his accounts are current, he may be making more and be less inclined to charge you for items not covered by your insurance coverage ... what you lose on the roundabout you make up on the swings. So too, if his secretary is less tied up with routine book keeping she may have more time for you.

The area that will effect you most directly will be your doctor's appointment system. Until recently, it hasn't been practical to use a computer for appointment scheduling. A doctor sees too many people with too many different conditions to use one of the standard appointment systems. He needs flexibility.

Efficient doctors use an appointment scheduling scheme called modified wave booking. This goes on the assumption that you can fairly accurately estimate how many patients you'll see in an hour even if you don't know how long each individual will take. If you then spread that number of bookings over that time, most people will be seen with a minimum wait and the doctor won't be sitting idly twiddling his thumbs. At least one company, run by a practising doctor, has come out with an appointment system that lets you initialize it to your style of practice ... one patient an hour or twenty a minute! Sixteen bit computers such as the I.B.M. PC can handle this with ease.

The big advantage to you will be that a good program will allow the secretary to enter the type of appointment you need and times that are best for you. Then, within seconds, you should have several choices. Furthermore, it should print out a list of patients for the secretary so she can phone you a day ahead to remind you. Your doctor can then use this same list on the appointment day so that he knows who and what he's seeing. There should be no last minutes searches for appropriate equipment and relevant information.

Reliable data base systems allow the appointment system to be tied in with the billing system so that data such as identification or in-

surance numbers need to be entered only once. Your doctor's secretary then has to make only minor changes each visit. This can be done with a full screen editor right at the time of making an appointment.

Words and Music

Another area that will effect you but which you won't see is word processing. If you are referred to a specialist, your own doctor usually sends along some sort of note telling what the problem is and why he's asking for the referral. Once the specialist has seen you, he'll send back a "consultation note", often many pages long, giving his recommendations to your family physician. Unfortunately, typing letters is often far down on a secretary's list of priorities, so while you're stewing over what's wrong with you and what has to be done, your letter's still swimming in the typing pool. With an efficient word processing package this area of congestion will be relieved.

In fact, many consultation letters that a specialist writes can be "almost form" letters. This is particularly true in the narrowest specialties such as eyes and allergies. With the entry of only a minimum amount of unique data, a consultation letter can be on the way as you're going out the door. This work both ways because sometimes your family physician is tempted not to write a referring letter if your problem is rather mundane and there's little to add to what you'll tell the consultant. Now it can be done in a snap.

An area where you may not think of the advantages of a word processor is in sick notes. How often have you asked your doctor for forms to be filled out to validate your absence for medical reasons? How often have you had to wait days or even weeks waiting for him to do this? Too often, I'll bet. Now your doctor can get his secretary to enter the relevant data. Then forms can be spewed out within minutes that fit every whim of the insurance industry.

Another area where standard business programs can be used is in inventory control. All those portions, band-aids and creams that your doctor pulls out of his myriad of cupboard have to be re-ordered. All those prescription pads, diet sheets and lab requisitions have to be printed periodically. All those out of date National Geographics ... I have current Computing Now!'s ... in the waiting room have to be re-subscribed to. A computer doesn't know if it's cataloguing widgets or scalpels. It can keep track of them all and tell what's needed, when and how much.

If these applications that I've mentioned so far were all that concerned a physician, most of us would have been using computers long ago. There are, however, a group of problems unique to a medical office that prevent the use

of standard business programs. The biggest of these is "third party billing."

What is third party billing? It simply means that somebody other than you pays for your medical care. This can be a private insurance, a government health plan or a provincial workman's compensation plan. It may even be the guy who ran into your new car with his Mack truck. The problem is that each of these parties requires billing in its own peculiar way on its own equally peculiar forms. In many cases they even pay different rates for the same thing. Worse, they change formats more often than Buckingham Palace changes guards. This is a dilemma for a computerized office. Either keep a programmer on staff to modify your programs every few months or stay with a manual system. Most of us have done the latter.

The most obvious way to get around the problem of multiple forms is to use an electronic medium ... magnetic tape, floppy disks or telephone lines. As you might expect, institutions that have been able to spawn countless forms have been equally proficient at refusing to accept an electronic standard. As a result,

most programs take the relevant data ... patient identification, diagnosis and fee ... and print it out on a paper form. This form is then sent by mail, courier or carrier pigeon to the processing center where yet another human types the data back into yet another computer.

The lunacy doesn't end here. After everything is processed, the central computer prints out its data ... patient identification, fee and payment ... and again trusts it to the vagaries of manually transportation. Don't give up yet! When this valuable piece of parchment arrives at your family doctor's door it's again entered by a human into the original computer and a reconciliation is done. I don't need to trace the path of any inaccuracies, missed payments or overlooked patients. You've already seen the problem.

As some standards emerge the problems with third party billing will clear up. I won't hold my breath waiting. This is too bad because this is probably the area in which a doctor would profit the most from a computer in the office. It's also too bad for you as patients, programmers and hardware sales people because until this problem is solved, a lot of

doctors won't buy computers. A large market will remain untappable.

Scalpel Please

The other big drawback to computerizing a medical office is your doctor himself. For some reason, doctors seem to be afraid of technology in the office. "It interferes with the doctor patient relationship." So do unnecessarily late appointments, misunderstood bills and lost consultation notes.

There are many systems available. I have seen three that seem suitable for personal computers and a well run medical office. The first is from MediSoft, a company run by a practising physician. It uses a Z-80 microprocessor and an S-100 bus system. You get two eight inch floppies and your choice of printers. All the software was written by this doctor. He has used it all in his office for over three years and it works. The fact that the system has been running for this long makes the system unique. Most vendors have one or two systems that have been running a month or so. Very often they haven't even this base. Yours will be their first.

Subs Ad

Just imagine. . .

Just imagine the thick, juicy features, the rich software and hardware reviews, the crisp fresh applications articles, the delicious programs that appear in every issue of Computing Now! magazine. Can't you just taste the up to the minute news and expertise that has made CN! the most widely read Canadian microcomputer publication?

A subscription to CN! is a perfect way to avoid missing your copy of this flavourful publication. It'll also save you some bread. A one year subscription is just \$22.95. Two years are just \$37.95.

Computing Now Subs

Computing Now! . . . More meat and no pain in the buns.

The Doctor's Little Black Computer

MediSoft is supported by Ultec Computer Corporation in Etobicoke, Ontario. Ultec supplies the hardware, the service warranty and service contracts. They have been around for quite a few years and I think they'll be around for a while to come. This is quite a contrast to all the computer systems companies that come and go with the change of seasons.

MediSoft's package does all that I mentioned before. It's main drawback is that it's run on an eight bit machine. Some of this drawback is made up for in software. The programs were written in CBASIC, the best business BASIC available. Later they were compiled using CB-80 to very tight and fast running machine code. Unfortunately, I think all the new business software is going to come out I.B.M. compatible. Nevertheless, this is the program that I would use in my office if I computerized today. There are a number of these systems running now as well as versions for dentists and chiropractors.

The second system that I like is from Mondecan Limited in Brampton, Ontario. This system uses the Zenith Z-100 microcomputer with a ten megabyte hard disk, a five and a quarter inch floppy drive and an eight inch floppy drive. Again, you have your choice of printers. There are at least eight of these systems working in the Toronto area.

There are a number of nice features about this system. The first is the Z-100 itself. It has two microprocessors. There's an 8085 to run eight bit programs and an 8088 to run sixteen bit ones. You'll even find a socket on the motherboard for the 8087. Most of the salesmen didn't know that! The other nice feature is the mass storage ... hard and two types of floppy. This isn't just window dressing ... longer fins on a car ... but a partial answer to the "third party problem" I mentioned earlier. The Ontario Health Insurance Program (OHIP) has been accepting billings on the eight-inch disks prepared by this program and sending back the payment information on the same disk. Naturally, being a true bureaucracy the Ontario Ministry of Health also insisted on a paper printout accompanying the disk but that's no problem just as long as nobody has to read it. The five and a quarter floppies allow you to use programs that are generally available in that format and the ten meg hard disks let you store data to your heart's content.

The software is written in Microsoft BASIC. The salesman wasn't sure whether it was compiled or not. I'm not sure he knew the difference. Right now, the programs are all written for eight bit computing since Microsoft BASIC isn't able to handle more than 64K of memory yet. This didn't seem to slow the program down at the demonstration booth.

I don't know who wrote the software but he definitely isn't a doctor or doctor's secre-

tary. There are a number of things that I found distressing. Telephone numbers are entered without a dash. When a screen of patient data is being entered, the secretary can't go back and correct any mistakes. She must continue to the end and then indicate that the data isn't correct before she can redo it. As someone proficient in programming, I know why the programmer did things the way he did. As an end user though, I'm not prepared to accept things being done just for the sake of the programmer.

The third system is still somewhat pie in the sky. The Ontario Medical Association (O.M.A.) ... our "union" ... has put together a package using the Texas Instrument's Professional Computer. Or at least they promise a package. There's a big difference. Some of the hardware isn't available just now and the software for government billing hasn't been written yet. It has been promised for the spring of 1984. Anybody who buys a computer system for which the software hasn't been written yet is nuts!

You've probably noticed that I've spent all my time talking about computers and medical office management. What about computerized patient care in your doctor's office? There isn't any.

Actual Medicine

In hospitals computers have taken over many old diagnostic tools. Computerized Axial Tomography machines (CAT scanners) use X-ray detectors rather than photographic film to record information and a real time computer then lets the radiologist dial up various views, close ups and angles from the data. In hospital laboratories, computerized auto-analysers that do twelve to twenty four blood tests at a crack give quicker, cheaper and more reliable results. Even in intensive care units, many of the monitoring instruments are overseen by computers and actually warn if serious abnormalities occur. It's conceivable that they could be programmed to take preventive action such as administering drugs through an intravenous line.

Unfortunately, these instruments have something more than computer control in common. They all cost astronomical amounts; a million dollars isn't uncommon. You just won't see any of these in a doctor's office. Not too many of us are starving but none of us has the kind of money necessary for this type of equipment.

Some companies have tried to introduce computerized instruments on a smaller scale. None of these, unfortunately, improves on the standard manual tools. Your doctor may have a microprocessor controlled blood pressure device. I sent mine back because my old manual one was just as accurate and didn't

scare my patients with flashing lights and beeping speakers.

The only device that has any real future is a one about the size of a small modem, that lets you read blood sugar levels from a drop of blood. The value is immediately shown on a liquid crystal display. People with diabetes that is difficult to control find these lifesaving. Unfortunately, they have an accuracy of plus or minus thirty percent; sufficient for home monitoring but inadequate for more precise measurements needed by a physician.

Software for patient care has lagged as well. There are many trivial programs that claim to interpret laboratory results more

"The biggest problem is third party billing."

reliably and objectively than a human can. Alas, the ones that I have seen merely tell me what I already had deduced as I entered the variables into the program. A more important reason that such programs haven't been developed is that the programmer must have an expert knowledge of the medical physiology involved. This requires that he be both a physician and professional programmer. There aren't many of these creatures around.

Files

I have left a huge area to the end on purpose ... the one that most physicians see as justifying a computer in the office. It's using a computer to store all your medical records. At first glance, this seems reasonable. Think of being able to immediately read all the information on Mrs. Smith and her family at the touch of a key. Think of using this data base for research into the incidence of various diseases, drug interactions and patient recalls. It just won't work.

Present medical files are a throwback to the turn of the century. Attempts to improve manual record keeping fall on deaf ears. Attempts to implement computer compatible records haven't even been made. If you're interested in looking further into this matter, I'd recommend *Physician's Primer on Computers* by J.F. Branejs. Even if this problem is overcome, there's still the inefficiency of entering all your information into the computer and thereby tying it up for anything else. I prefer my scribbled notes with matchstick drawings any day.

The area for computer applications in medicine with the most potential that's still untouched is electronic mail. Earlier I mentioned advantages of a word processor in easing doc-

tor to doctor communications. This could be even faster if all those lab reports, consultation letters and hospital bookings were sent over the telephone, stored on hard disk and then printed out as needed. So too, your doctor could dial up an international medical data bank to get him instant access to recent diagnostic and treatment advances. Think how useful this could be to an isolated physician in Northern Ontario.

I expect to see better patient education by computer. Instead of being bored with out of date magazines, you could use a terminal in the waiting room to learn about nutrition, birth control and other topics that take a lot of time to discuss but which really don't need your doctor present. I expect to see programs that will let your doctor enter your present medication, what he plans to prescribe and other pertinent data such as your size and age. Within seconds, he would have guidelines to the dose as well as possible side effects and interactions. But you and your doctor would benefit.

"What about computerized patient care? There isn't any."

I hope this article has prepared you for some of the changes you'll be seeing in your doctor's office as he adapts to computer technology. I hope it will open your mind to ways to advance this process and profit from it. There are a lot of programs that need to be thought up, written and sold. There are about thirty two thousand doctors in Canada who could be persuaded to hire you to advise them on buying a system, to help implement computerization and to customize some of their programs. Maybe one of you reading this article will dream up the medical equivalent of VisiCalc.

Your computer's telephone. Hayes

What are the adverse effects of this compound?

Gary: The pedigrees for next week's auction are as follows...

Sold 1000 shares at 33 for net profit of 6000. Richard.

Wouldn't it be great if you could use your IBM® PC to tap into vast resource libraries across the country? To transfer files to your partner, upstate? Or from your broker, down the street?

It's possible. All you need is a modem, to connect your computer to others. Down the hall. Or thousands of miles away.

Hayes Smartmodem. Think of it as your computer's telephone. Hayes Smartmodem 300™ and the faster Smartmodem 1200™ allow you to communicate over ordinary phone lines.

But any modem will send and receive data. Hayes Smartmodems

also dial, answer and disconnect calls. Automatically. And without going through the telephone receiver, making them far superior to acoustic coupler modems.

Choose your speed; choose your price. The lower-priced Smartmodem 300 is ideal for local data swaps and communicates at 300 bps. For longer distance and larger volumes, Smartmodem 1200 operates at baud rates of 300 or 1200, with a built-in selector that automatically detects transmission speeds.

Both work with rotary dials, Touch-Tone® and key-set systems; connect to most time-sharing systems; and feature an audio speaker.

Smartmodem 1200B™ is also available as a plug-in board. Developed specifically for the PC, it comes packaged with Hayes' own communications software, Smartcom II™.

Smartcom II. We spent a lot of time developing it, so you can spend less time using it. Smartcom II prompts you in the

simple steps required to create, send, receive, display, list, name and rename files. It even receives data completely unattended—especially helpful when you're sending work from home to the office, or vice versa.

If you need it, there's always "help." This feature explains prompts, messages, etc. to make communicating extra easy.

With Smartcom II, it is. Case in point: Before you communicate with another system, you need to "set up" your computer to match the way the remote system transmits data. With Smartcom II, you do this only once. After that, parameters for 25 different remote systems are stored in a directory on Smartcom II.

Calling or answering a system listed in the directory requires just a few quick keystrokes.

You can store lengthy log-on sequences the same way. Press one key, and Smartcom II automatically connects you to a utility or information service.

Hayes™

Smartmodem 1200B. (Includes telephone cable.
No serial card or separate power source is needed.)

Smartcom II communications software.

NOTE: Smartmodem 1200B may also be installed in the IBM Personal Computer XT or the Expansion Unit. In those units, another board installed in the slot to the immediate right of the Smartmodem 1200B may not clear the modem; also, the brackets may not fit properly. If this occurs, the slot to the right of the modem should be left empty.

And, in addition to the IBM PC, Smartcom II is also available for the IBM Personal Computer XT, DEC Rainbow 100, Xerox 820-II, Kaypro II, Compaq Portable, Corona Portable PC, and Columbia MPC.*

Backed by the experience and reputation of Hayes. A solid leader in the microcomputer industry, Hayes provides excellent documentation for all products. A limited two-year warranty on all hardware. And full support from us to your dealer.

So see him today. Break out of isolation. Get a telephone for your Personal Computer. From Hayes.

New Products

Hard Disk Portable

Corona Data Systems, Inc. has announced the addition of a portable hard disk-based personal computer to its popular family of sixteen bit IBM PC-compatible microcomputers.

The PPCXT, like other models in the Corona family, is compatible with virtually all software applications independently developed for the IBM Personal Computer. It addresses user requirements for greater disk storage and it offers a host of standard features and expansion capabilities.

The Corona PPCXT incorporates a half-height, five and a quarter inch ten megabyte Winchester disk drive in the slot where a second floppy drive is located in the company's floppy-based portable P.C. The base unit includes an Intel 8088 CPU, two hundred and fifty-six kilobytes RAM a ten megabyte hard disk drive, a three hundred and sixty K drive, hard disk controller, RS-232C serial port, Centronics-compatible parallel port, detachable eighty-three key IBM PC-compatible keyboard, four IBM PC-compatible expansion slots and graphics resolution of six

hundred and forty by three hundred and twenty-five pixels.

Bundled software includes MS-DOS Release 2.0, GW Basic, MultiMate word processor and PC Tutor self-teaching program.

For more information contact Corona Data Systems, 31324 via Colinas, Suite 110, Westlake Village, CA 91361 (213) 706-1505.

3-D Calculations

Report Manager by Datamension Inc. is a 3-D spreadsheet that has two hundred and fifty five by two hundred and fifty-five cells per page and is two hundred and fifty-five pages deep. Full computation with graphics, and data transfer is possible in all three dimensions. This package has been completely rewritten to take advantage of viewing. This spread sheet is not a Calc-clone, but a powerful data management spreadsheet. Report Manager is distributed in Canada by Remtek in Shelburne, Ontario.

Interested parties can contact Remtek at P.O. Box 668, Shelburne, Ontario L0N 1S0.

Disk/Video Interface

A new TRS-80 Disk/Video Interface will ensure that home and business users are able to realize the full potential of Radio Shack's Model 100 portable computer.

The interface contains one five and one quarter inch double density floppy disk drive, which allows for maximum storage of one hundred and eighty-four K. An optional second internal floppy disk unit can be added. The video interface allows for connection of the Model 100 to a standard video monitor. It will display twenty five lines of forty or eighty characters (user-selectable). A built-in RF converter also allows connection of the Model 100 to a regular television set, with twenty five by forty character display. The video interface will not support dot graphics.

When connected, the

Disk/Video interface automatically loads special software into the Model 100 to provide the linkage between the two units. A minimum of sixteen K of memory is required in the Model 100.

The Disk/Video interface is available at Radio Shack Computer Centres, stores and authorized dealers from coast to coast.

Lotus 1-2-3 for Tandy 2000

Tandy Corporation has signed an agreement with Lotus Development Corporation to offer one of the most popular microcomputer software programs on the market for use on the Tandy TRS-80 Model 2000 personal computer.

Lotus 1-2-3 integrated software has been widely acclaimed for the speed at which it manipulates data. The Tandy 2000's advanced Intel 80186 processor and faster clock speed enables Lotus 1-2-3 to perform several times faster than on 8088-based personal computers.

The spreadsheet is capable of handling two thousand and forty-eight rows of two hundred and fifty-six columns and uses all available memory.

Equipment required to use Lotus 1-2-3 includes the

Tandy 2000 with at least two hundred and fifty-six kilobytes of RAM. The program may be used with the VM-1 High Resolution monochrome monitor with optional High-Resolution Monochrome Graphics or the CM-1 Colour Monitor with colour graphics option. The optional graphics features are recommended.

Lotus 1-2-3 will be available by mid-1984 at Radio Shack Computer Centres, and participating stores and dealers nationwide. **CNI**

Product will be shipped same day. All Ontario res + 7% sales tax.

Book of the Month

A practical guide for anyone who needs to control and access large amounts of data with a microcomputer. Complete tutorial shows routines you can use to write and implement your own data-base programs. Also explains step-by-step operation of WHATSIT, SELECTOR, and PROFILE, just 3 of many data-base packages on the market, and evaluates their performance.
